## C1. Legal information

### C1.1. Definitions

**Draft** – A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. Envox does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

### C1.2. Disclaimers

**Limited warranty and liability** – Information in this document is believed to be accurate and reliable. However, Envox does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. Envox takes no responsibility for the content in this document if provided by an information source outside of Envox.

In no event shall Envox be liable for any indirect, incidental, punitive, special or consequential damages (including – without limitation – lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, Envox' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of Envox.

**Right to make changes** – Envox reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** – Envox products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an Envox product can reasonably be expected to result in personal injury, death or severe property or environmental damage. Envox and its suppliers accept no liability for inclusion and/or use of Envox products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** – Applications that are described herein for any of these products are for illustrative purposes only. Envox makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using Envox products, and Envox accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the Envox product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

Envox does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using Envox products in order to avoid a default of the applications and the products or of the application or use by customer's 3rd party customer(s). Envox does not accept any liability in this respect.

**Suitability for use in non-automotive qualified products** – Unless this data sheet expressly states that this specific Envox product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. Envox accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without Envox' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer

uses the product for automotive applications beyond Envox' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies Envox for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond Envox' standard warranty and Envox' product specifications.

**Security** – Customer understands that all Envox products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their life cycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by Envox products for use in customer's applications. Envox accepts no liability for any vulnerability. Customer should regularly check security updates from Envox and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by Envox.

To report a security issue, use the EEZ Studio [issue tracker](#).

### C1.3. Miscellaneous

**Open source license and contributions** – EEZ Studio uses the *GPL v3* license. To view a copy of this license, please visit <https://www.gnu.org/licenses/gpl-3.0.html>. EEZ Studio uses the [C4.1 \(Collective Code Construction Contract\)](#) process for contributions.

This document is released under *open license FDL v1.3* from GNU.org. Therefore you are entitled to freely copy and redistribute it, with or without modifying it, either commercially or non-commercially. For additional details please consult the content of the [license](#).

**Terms and conditions of commercial sale** – Envox products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.envox.eu/company/terms-of-use/>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. Envox hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of Envox products by customer.

**Translations** – A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

**Export control** – This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Trademarks** – All referenced brands, product names, service names, and trademarks are the property of their respective owners.

### C1.4. Contact information

If you have any problem or requirement when using EEZ products or this manual, please contact Envox:

Discord server: <https://discord.gg/dhYMnCB>

E-mail: [support@envox.eu](mailto:support@envox.eu)

Website: [www.envox.eu](http://www.envox.eu)

### C1.5. Revision history

Date	Version	Changes
2023-08-31	0.10.3 (M17)	Initial release
2024-04-08	0.12.0 (M18)	Home page redesign

## C2. The EEZ Studio overview

### C2.1. Introduction

EEZ Studio was initially developed as a companion application for the in-house developed [EEZ H24005](#) programmable power supply and [EEZ BB3](#) T&M chassis to address two important tasks: a) remote programming and management and b) simplifying the development of a feature rich embedded GUI for a color touch-screen display.

The development was inspired by the idea of offering an open source alternative to some existing commercial solutions that are used for the mentioned tasks, all in order to overcome the limitations of their closed code, outdated and complex UI or sometimes awkward UX and licensing, which in our case was not in accordance with the open source of the mentioned devices that we have developed.

### C2.2. Main sections

EEZ Studio consists of two main sections, which are described separately in the manual:

- **Project** – creating, editing, debugging and building the code for the embedded GUI project for the selected target platform. Generated code can be directly imported into the IDE/toolchain used to build the firmware and accelerate the development process. It enables the rapid development of high quality embedded GUI and also comes with support for the open-source LVGL graphics library. The drag-and-drop editor makes it easy to utilize the many features such as widgets, animations, and styles to create a GUI reducing the coding effort. Additionally flowchart-like *EEZ flow* programming feature will further save development time and complexity.
- **Instrument** – allows access to one or more T&M instruments using several communication interfaces through which it is possible to manage and collect measurement data and screenshots using SCPI commands and queries. Collected data can be analyzed, searched, annotated and exported to other applications. Automation of test and measurement tasks using JavaScript and *EEZ flow* programming allows it to be used in different scenarios from basic development, calibration, troubleshooting and quality control using multiple devices from different manufacturers that can be in different locations connected to LANs.

In the introductory chapters of the two main sections that follow, all important features will be listed and described in detail.

### C2.3. Known issues and issue reporting

EEZ Studio is continuously developing and improving. A list of known issues can be found on [GitHub](#) where you are also invited to leave your suggestions for improvements and new functionality.

When reporting bugs using the GitHub tracking system, please first check if the issue you want to report has already been reported by someone else. When opening a new ticket, the following information can simplify and speed up the resolution:

- Descriptive/detail name of the issue (avoid general descriptions)
- Installed operating system version
- Installed EEZ Studio version
- Steps to reproduce the problem you are reporting

### C2.4. Donations

As an open source project, EEZ Studio has been largely developed thanks to donations primarily from [NLnet Foundation](#) as well as a number of smaller individual donors. If you want to contribute to further development with your donation, you can use [Liberapay](#).

## C3. Installation

### C3.1. System requirements

EEZ Studio is a 64-bit application. Therefore the minimum requirement for installation is a personal computer with a 64-bit operating system installed which has enough RAM and disk space for smooth operation.

Installation packages for supported operating systems for all versions of EEZ Studio are available for download at <https://github.com/eez-open/studio>

It is the official download page and we recommend that you get the latest version for the first installation. You will be able to check for future updates by using the option provided for that, as described below. If EEZ Studio becomes available on the websites of our partners, this information will be published on the Envox official website.

### C3.2. Linux

Depending on your linux distribution, choose one of the listed packages (.deb, .rpm) and start the installation using the associated installer.

In addition, there is a self-executing .AppImage version that, after downloading, needs to enable the Allow executing file as program option under file Permissions (Fig. 1) before starting it.

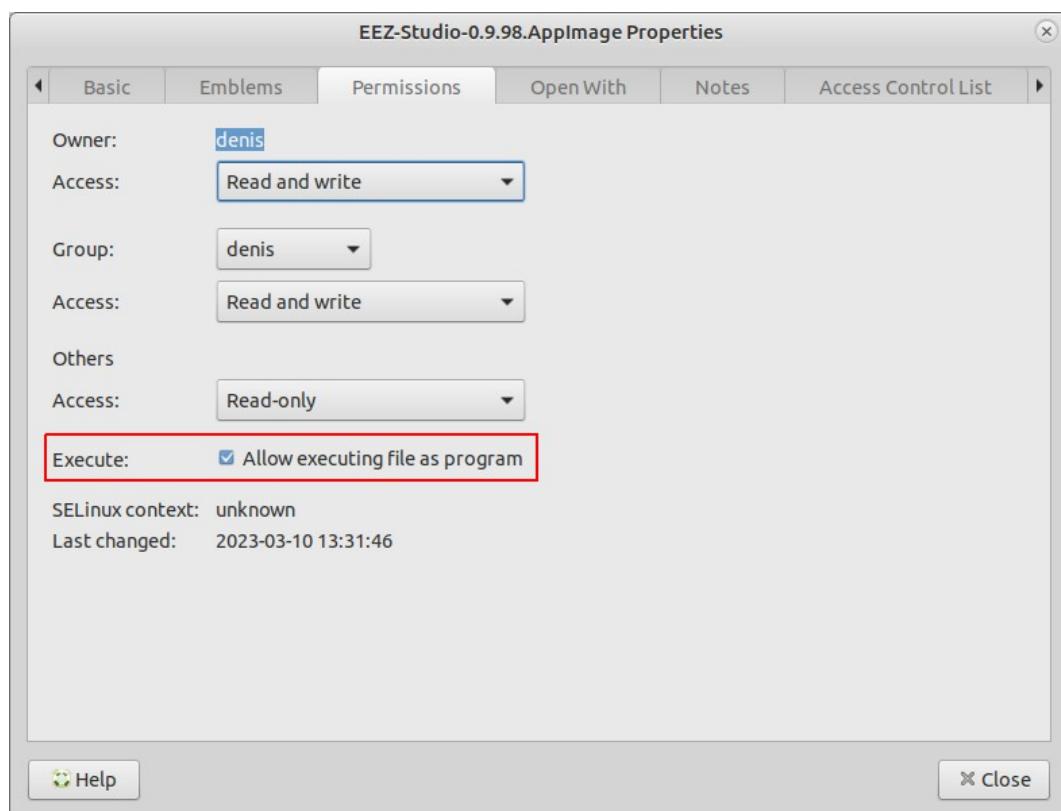

Fig. 1: .AppImage file permission

If you encounter a problem running the .AppImage version on your Linux distribution, try running it using the --no-sandbox option: ./EEZ-Studio-[version].AppImage --no-sandbox

### C3.3. Mac

Required OS version: macOS 10.10 (Yosemite) or newer

Download *eezstudio-mac.zip*, unpack and move *eezstudio.app* to Applications.

### C3.4. Windows

Required OS version: Windows 7 (64-bit) or newer

Download and start *EEZ\_Studio\_setup.exe*.

### C3.5. Nix package manager

The Nix [flake](#) provides a derivation for EEZ Studio or an overlay that provides that derivation. It can be used to install the project using [Nix package manager](#).

### C3.6. Build and run from source (all operating systems)

In addition to using ready-made installation packages, it is possible to build and run EEZ Studio directly from the source code located in the GitHub repository. Below is the procedure to be followed:

- Install *Node.JS 14.x or newer*
- Install *node-gyp*, more information at <https://github.com/nodejs/node-gyp#installation>

#### C3.6.1. Linux only

```
sudo apt-get install build-essential libudev-dev
```

#### C3.6.2. Raspbian only

Install *Node.js 16* and *npm* on Raspberry Pi: <https://linode.com/install-node-js-and-npm-on-raspberry-pi/>

```
sudo apt-get install build-essential libudev-dev libopenjp2-tools ruby-full  
sudo gem install fpm
```

#### C3.6.3. All platforms

In the folder where you want to build the project, it will be necessary to clone the GitHub project repository, and start project building as follows:

```
git clone https://github.com/eez-open/studio  
cd studio  
npm install  
npm run build
```

Start with:

```
npm start
```

Create distribution packages (except [Raspbian](#)):

```
npm run dist
```

#### C3.6.4. Raspbian

```
npm run dist-raspbian
```

#### C3.6.5. Nix

To build:

```
nix build 'github:eez-open/studio'
```

To start:

```
nix run 'github:eez-open/studio'
```

### C3.7. USB TMC

The USB TMC driver must be installed if you want to access the T&M instrument using the USB-TMC interface from EEZ Studio *Instrument* section.

### C3.7.1. Windows

Download and start [Zadig](#). Select your device, select libusb-win32 and press “Replace Driver” button:

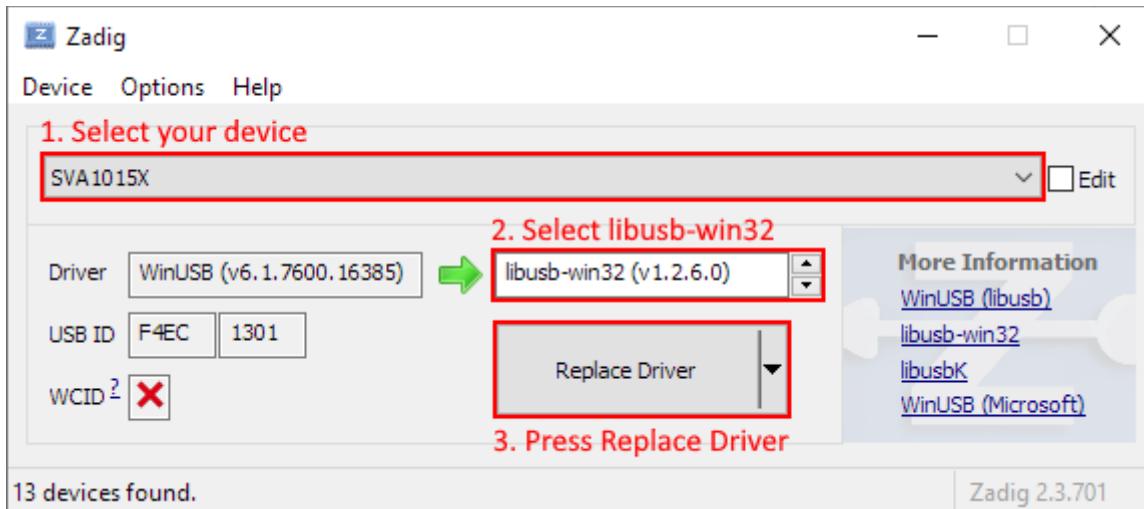

Fig. 2: Zadig driver settings

### C3.7.2. Linux

You will probably need to add your Linux account to the `usbtmc` group before you can access the instrument using EEZ Studio. Connect your instrument with a USB cable and turn it on. Wait until booting is complete. Now check the instrument group name by entering the following command:

```
ls -l /dev/usbtmc*
```

In case it is *root*, enter the command:

```
sudo groupadd usbtmc
```

Now, add your account (<username>) to the group:

```
sudo usermod -a -G usbtmc <username>
```

A reboot is required. After that, the *gid* of `/dev/usbtmc0` should be set to `usbtmc` and you are ready to use your instrument via USB-TMC interface.

### C3.8. FAQ

**Q:** Where is the database file by default?

**A:** Depending on the operating system, it can be:

- **Linux:** `~/.config/eezstudio/storage.db`
- **Mac:** `~/Library/Application\ Support/eezstudio/storage.db`
- **Windows:** `%appdata%\eezstudio\storage.db`

The default created database as well as its location can be changed later through the options in the *Settings* section of EEZ Studio.

**Q:** Where are the IEXTs (Instrument EXTensions) used to access T&M instruments stored?

**A:** Depending on the operating system, it can be:

- **Linux:** `~/.config/eezstudio/extensions`
- **Mac:** `~/Library/Application\ Support/eezstudio/extensions`
- **Windows:** `%appdata%\eezstudio\extensions`

## C4. Key Features

### C4.1. General

- Modern and attractive UI/UX developed in [Electron](#)
- Light / Dark theme
- Multi-tab support for faster navigation
- Cross-platform run-time (Linux, Windows, macOS)
- Modular design based on plug-ins that can be added/removed depends of scope of the work
- Source/Version control integration ([GitHub](#) and [gitea.io](#))
- Free and open source

### C4.2. EEZ Studio Project

- Modular visual development environment for rich embedded GUI (small display/limited resources) and desktop GUI
- *EEZ Flow*, low-code flowchart programming for both rapid prototyping and creation of complex applications
- [LVGL](#) (Light and Versatile Graphics Library) support
- Multi-language support
- Support for unlimited number of Color Themes, Widget styles, user created Widgets and Actions
- Adding new functionality using Project extensions
- Generate C++ code for embedded GUI functionality that can be directly included in [STM32CubeIDE](#) for EEZ BB3 and other STM32 target platforms or [Arduino IDE](#) for EEZ H24005 and other Arduino compatible target platforms
- *Instrument definition file* (IDF) builder with context sensitive SCPI commands help (based on Keysight's [Offline Command Expert command set](#) XML structure) suitable for EEZ Studio *Instrument* and [Keysight Command Expert](#)
- SCPI command help generator based on bookmarked HTML generated directly from .odt file using [EEZ WebPublish](#) extension for OpenOffice/LibreOffice.
- Project templates (using giteo.io repositories) and comparison of projects
- Drag&drop editor for creating instrument's desktop dashboard (for remote control and management)

### C4.3. EEZ Studio Instrument

- Dynamic environment where multiple instruments can be configured and easily accessed
- Session oriented interaction with each SCPI instrument
- Serial (via USB), Ethernet and VISA (via free [R&S@VISA](#)) T&M instrument interfaces support
- Direct import of EEZ Studio generated IDFs and Keysight's Offline Command Expert command sets
- IEXT (Instrument EXTension) catalog with growing number of supported instruments (Rigol, Siglent, Keysight, etc.)
- History of all activities with search/content filtering
- Quick navigation via calendar ("heatmap") or sessions list view
- Shortcuts (hotkeys and buttons) that can be user defined or come predefined from imported IDF. The shortcut can contain single or sequence of SCPI commands or Javascript code.
- Javascript code for task automation (e.g. logfile, or programming list upload/download, etc.) can be also assigned to the shortcut
- SCPI commands context sensitive help with search
- File upload (instrument to PC) with image preview (e.g. screenshots)
- File download (PC to instrument) automation for transferring instrument profiles
- Simple arbitrary waveform editor (envelope and table mode)
- Displaying measurement data as graphs
- FFT analysis, harmonics and simple math functions (Period, Frequency, Min, Max, Peak-to-Peak, Average)
- Export graphs as .CSV file

## C5. Menu options and Settings

### C5.1. Home page

After starting EEZ Studio, the home page is displayed (Fig. 3). At the top of the page there is a toolbar with options for working with Projects, Instruments, Extensions and EEZ Studio settings.

The options for working with projects (*Open*, *Create* and *Examples*) will be described in detail in the chapters that start with the prefix P. (i.e. P.1, P.2, ...), and the *Instruments* section in chapters started with prefix I.

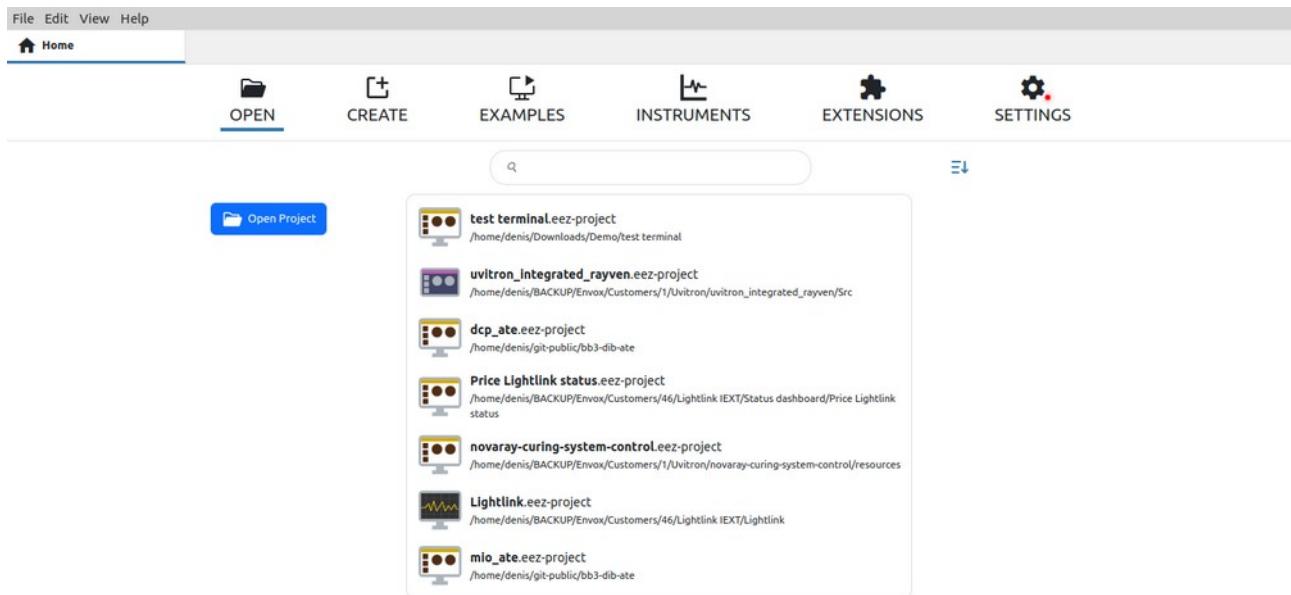

Fig. 3: Home page

### C5.2. Menu options

Menu options available from all main sections of EEZ Studio are listed below.

#### C5.2.1. File

Option	Shortcut	Description
New project...	CTRL + N	Creates a new project.
Add instrument...	ALT + CTRL + N	Adds an instrument to the EEZ Studio workbench that can be controlled.
New Window	CTRL + SHIFT + N	Opens a new copy of the window.
Open...	CTRL + O	Opens an existing project.
Open Recent	-	List of recently opened projects.
Reload (Projects only)	-	Reload currently selected project. If there are unsaved changes, a message will appear asking if you want to save the messages before reloading.
Load Debug Info... (Projects only)	-	Loads the debugger state and switches the project to Debug mode. <i>Note: this is a valid operation only in the project in which the debugger state file was generated.</i>

<i>Save Debug Info... (Projects only)</i>	–	When the project is in <i>Debug</i> mode, use this option to save the debugger state to a file.
<i>Import Instrument Definition...</i>	–	Import IEXT (Instrument EXTension) file.
<i>Save</i>	CTRL + S	Saving project files.
<i>Save as (Projects only)</i>	CTRL + SHIFT + S	Saving the project under a different name.
<i>Check (Projects only)</i>	CTRL + K	Opens the <i>Check</i> panel of the project.
<i>Build (Projects only)</i>	CTRL + B	Starts the build procedure and opens the <i>Build</i> panel of the project.
<i>Build Extensions (Projects only)</i>	–	Build IEXT .zip files only if the project has IEXT (Instrument EXTension) definitions.
<i>Build and Install Extensions (Projects only)</i>	–	The same as the previous option and in addition the IEXTs that have been built are installed immediately.
<i>Exit</i>	–	EEZ Studio shutdown.

### C5.2.2. Edit

Option	Shortcut	Description
<i>Undo</i>	CTRL + Z	Undo previous action.
<i>Redo</i>	CTRL + Y	Redo previous action.
<i>Cut</i>	CTRL + X	Move content to Clipboard.
<i>Copy</i>	CTRL + C	Copy content to Clipboard.
<i>Paste</i>	CTRL + V	Paste content from Clipboard.
<i>Delete</i>	DEL	Delete selected content.
<i>Select All</i>	CTRL + A	Select all content.

### C5.2.3. View

Option	Shortcut	Description
<i>Home</i>	–	Return to the <i>Home</i> tab.
<i>History</i>	–	Opening the Instrument's <i>History</i> tab.
<i>Shortcuts and Groups</i>	–	Opening the Instrument's <i>Shortcuts and Groups</i> tab.
<i>Notebooks</i>	–	Opening the Instrument's <i>Notebooks</i> tab.
<i>Extension Manager</i>	–	Opening the Instrument's <i>Extension Manager</i> tab.
<i>Settings</i>	–	Opening the <i>Settings</i> tab (Fig. 4).
<i>Toggle Full Screen</i>	F11	View EEZ Studio in full screen (select F11 again to restore).
<i>Toggle Developer Tools</i>	CTRL + SHIFT + I	Opening the developer tools in the right part of the window.
<i>Switch to Dark Theme</i>	CTRL + SHIFT + T	Toggle between Light and Dark theme.
<i>Zoom In</i>	CTRL + +	Zoom in (enlargement) of all screen elements. On some Linux distributions you will need to use CTRL + SHIFT + + as a shortcut.
<i>Zoom Out</i>	CTRL + -	Zoom out (reduction) of all screen elements.
<i>Reset Zoom</i>	CTRL + 0	Returning the zoom to the default level.
<i>Reload</i>	–	Reload all content.

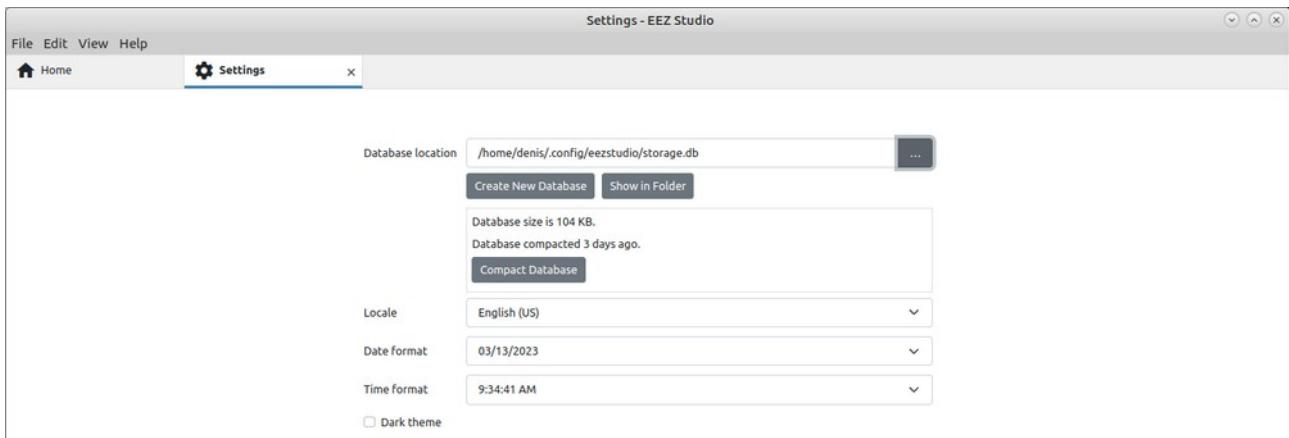

Fig. 4: Settings tab

**Database location**

A database is used to store the data collected in communication with the instruments. An empty base is created at first launch and its location can be seen here. You can also change the location here to one of the existing databases (backup, imported from another EEZ Studio, etc.).

*Changing the parameters of the database requires a restart of EEZ Studio. The Restart button will be displayed in the lower right corner.*

**Create New Database**

Creating a new database with the name and location you specified.

**Show in Folder**

View the folder where the database is located.

**Locale**

Defines the date and time formats for the selected country.

*Changing the Locale requires a restart of EEZ Studio. The Restart button will be displayed in the lower right corner.*

**Date format**

Display format of all date values.

**Time format**

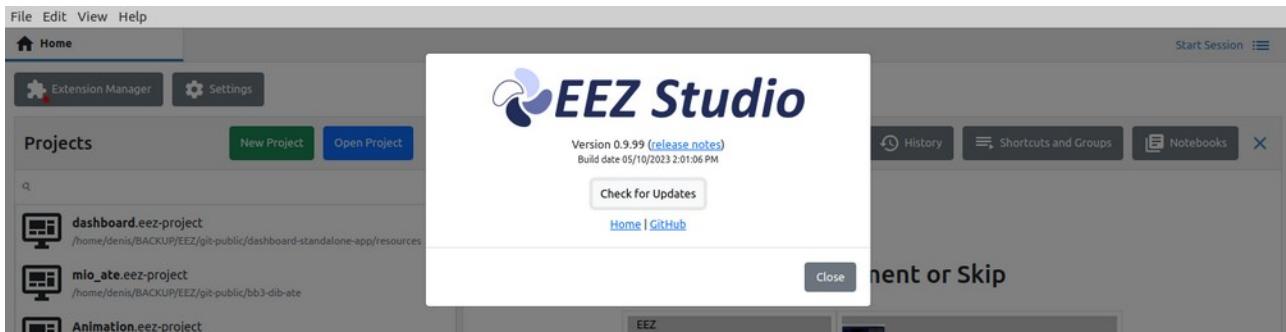

Display format of all time values.

**Dark theme**

Toggle between Light and Dark theme (same as shortcut CTRL + SHIFT + T).

**C5.2.4. Help**

Option	Shortcut	Description
About	-	Opens the EEZ Studio version information (Fig. 5).

*Fig. 5: About page*

### **Check for Updates**

This function requires an internet connection in order for EEZ Studio to connect to the GitHub repository and check for a newer version than the one installed.

This function does not take into account versions that have a pre-release status, but only released versions.

### **Home**

Opens the home page of the Envox official site (requires internet browser installed).

### **Github**

Opens Envox's GitHub home page (requires internet browser installed).

*EEZ Studio  
Project*

## P1. Home page project sections

One of the important features of EEZ Studio is that it enables the creation of projects for different target platforms using different technologies, which will be described below. The *Projects Open* section of the home page is shown in Fig. 1. which displays a searchable Recent Project List (RPL).

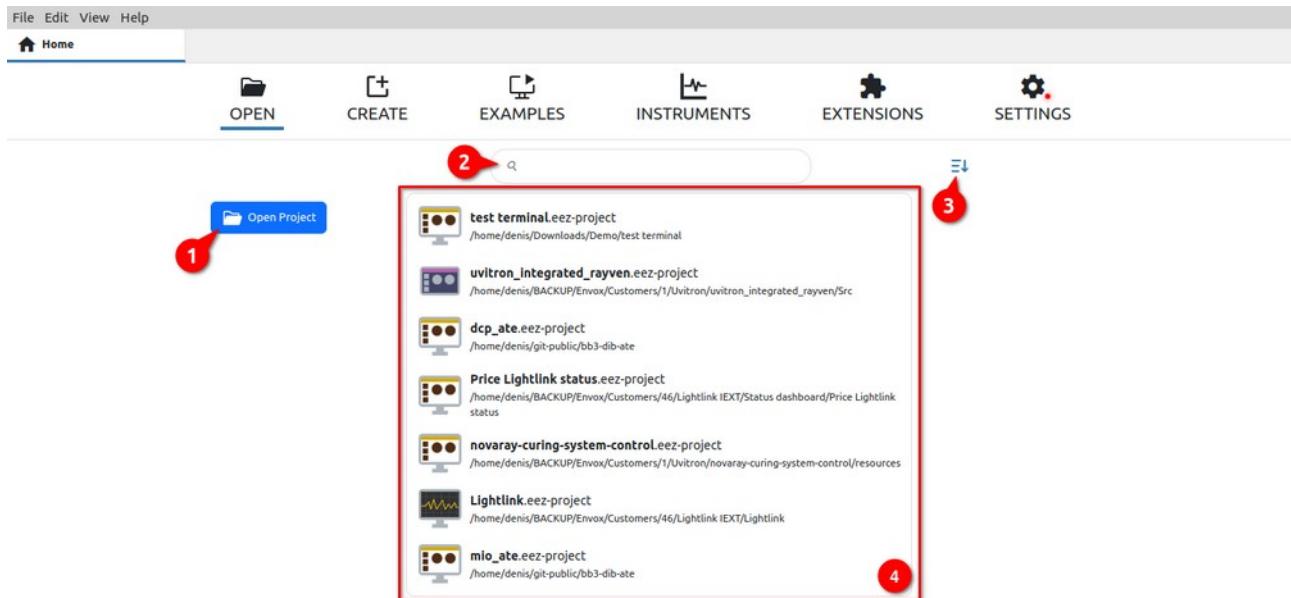

Fig. 1: Home page open project options

#	Option	Description
1	<i>Open project</i>	Opening an existing project (will be added to RPL after successful loading).
2	<i>Search RPL</i>	RPL search by project name.
3	<i>RPL sort order</i>	Sorting order of projects in RPL: It can be <i>Show most recent first</i> or <i>Sort alphabetically</i> .
4	<i>Recent Project List (RPL)</i>	List of all successfully loaded projects after the first run.

### P1.1. EEZ Studio project types

EEZ Studio offers the creation of the following project types:

- **Dashboard** – desktop application. GUI applications can be quickly and easily created thanks to the drag & drop of available widgets and the import of multiple fonts and ready-made bitmaps prepared by the designer. The animation editor allows adding simple animations to the desired sections of the page or navigation between pages. Finally, the flowchart method of defining program logic instead of programming in one of the programming languages will further speed up prototyping and creation of the final application. The implemented debugger will shorten the application development process and help in more efficient error detection.
- **EEZ-GUI** – embedded GUI application that uses the EEZ-GUI framework. This is a native EEZ Studio framework that was initially developed to speed up and simplify embedded GUI development for [EEZ H24005](#) and [EEZ BB3](#) firmware.
- **LVGL** – embedded GUI application that uses LVGL (Light and Versatile Graphics Library) framework. LVGL is a popular open source project that supports a large number of target platforms. For more information visit <https://lvgl.io/>

- **LVGL with EEZ Flow** – similar to the previous type embedded GUI application that uses LVGL (Light and Versatile Graphics Library) framework but with the addition of the EEZ Flow project development.
- **BB3 Applet** – GUI application that can be run on EEZ BB3. Program logic is created using EEZ Flow (flowchart-based programming).
- **BB3 MicroPython script** – GUI application that can be run on EEZ BB3. Program logic is created using MicroPython scripting.
- **Templates from gitea repository** – Various projects located in the gitea.io repository (mostly based on the EEZ-GUI framework). They can be used as a starting point for creating new projects.

## P1.2. Create new project

Creating a new project is possible by selecting the *Create* option from the Home page toolbar when the Create tab is displayed. (Fig. 2).

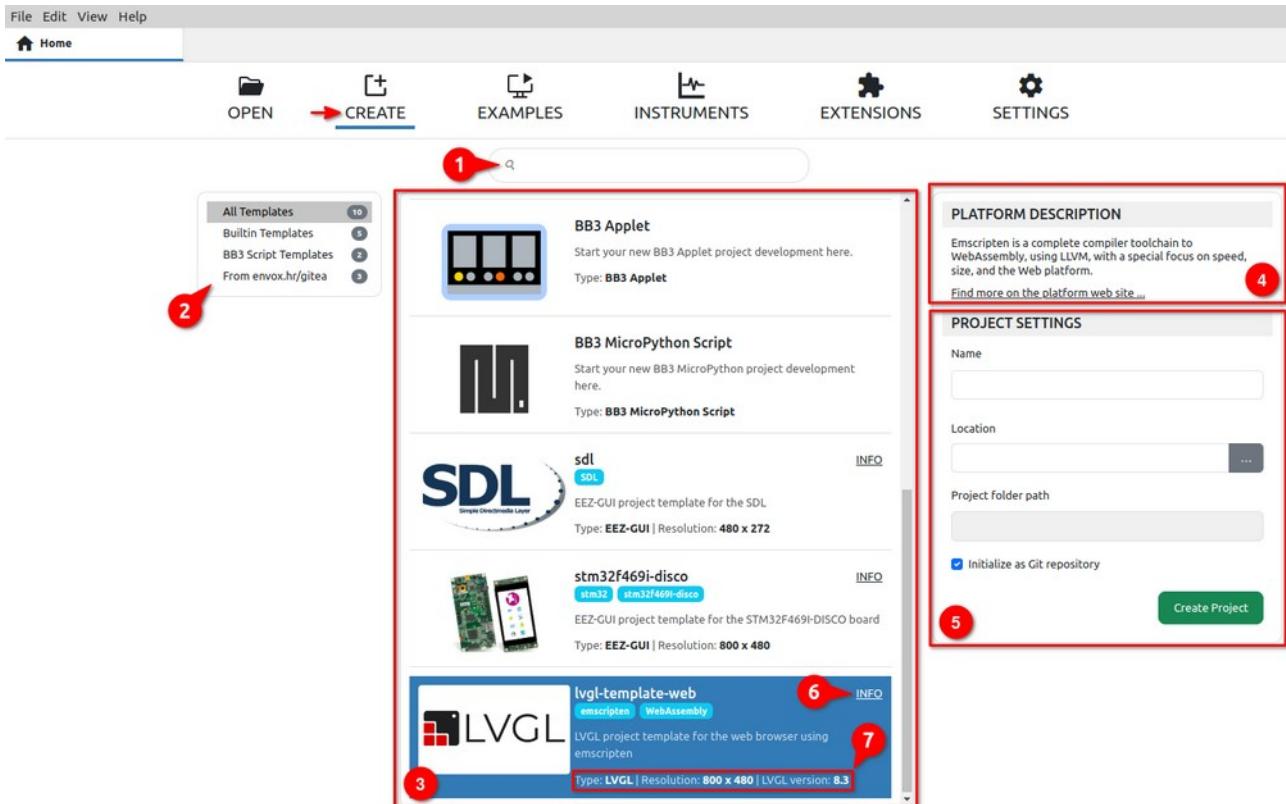

Fig. 2: Create new project

#	Option	Description
1	<i>Search</i>	Search by project name.
3	<i>Project list</i>	List of all projects within the selected category, grouped into expandable sublists.
3	<i>Project selector</i>	Project selector from the currently selected subgroup. By navigating through the list, the Project settings are displayed on the right. Positioning the cursor on the project thumbnail changes the cursor icon, and clicking on it enlarges the image.
4	<i>Platform description</i>	When present, it provides a description of the target platform for which the project is intended, as well as a link to an external website with additional information about the platform.
5	<i>Project settings</i>	Project basic parameters (see below).
6	<i>Info</i>	If the project has a Git repository, this link will appear that takes you to the repository home page.

## 7 Project details

Basic information about the project: type, screen size and, in the case of an LVGL project, the version of the library used.

### P1.3. Project basic settings

#### Name

The name of the new project.

#### Location

The location where the project files will be stored.

#### Create directory

If selected, a subdirectory (at Location) with the name of the project will be created. This option is not available if the project is taken from a Git repository (in this case a new folder is always created).

#### Project file path

Information field (read-only) showing the resulting path in which the new project will be created.

#### Clone Git repository

When creating a new project from an Example sourced from a Git repository, the `.eez-project` file is always copied. Check this option if you want all other files from the repository to be copied.

#### Initialize as Git repository

Specifies whether the newly created project from the selected template will be immediately initialized as a Git repository. The option does not need to be checked if you do not use Git for source control.

### P1.4. Additional steps for creating EEZ BB3 projects

New *Applet* and *MicroPython script* projects require access to the EEZ BB3 firmware master project from which exported styles, fonts and themes are used to make the GUI of the newly created application compatible with the EEZ BB3 on which it will be executed.

The necessary EEZ BB3 master project can be downloaded from GitHub (Fig. 3) when creating a new project or set a reference to a local copy of the repository (Fig. 4).

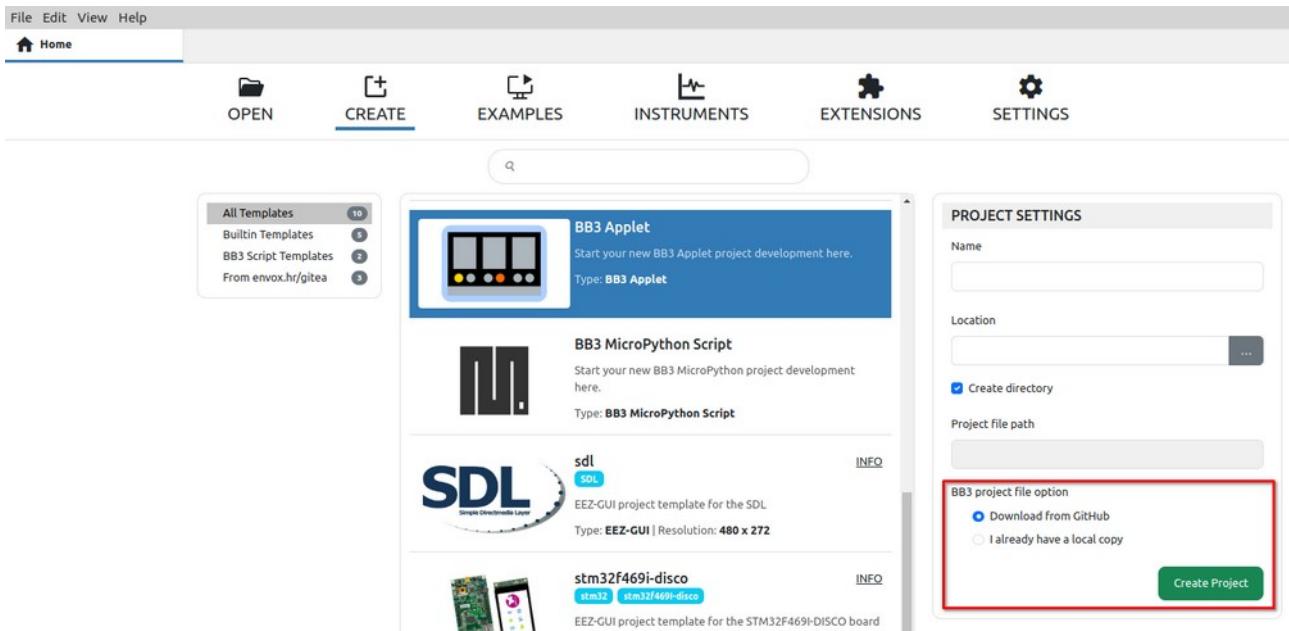

Fig. 3: EEZ BB3 applet new project additional option

When creating a *MicroPython script* project, it will be necessary to define which firmware version is used on the target EEZ BB3 in order to create the corresponding resource file during the build (Fig. 4).

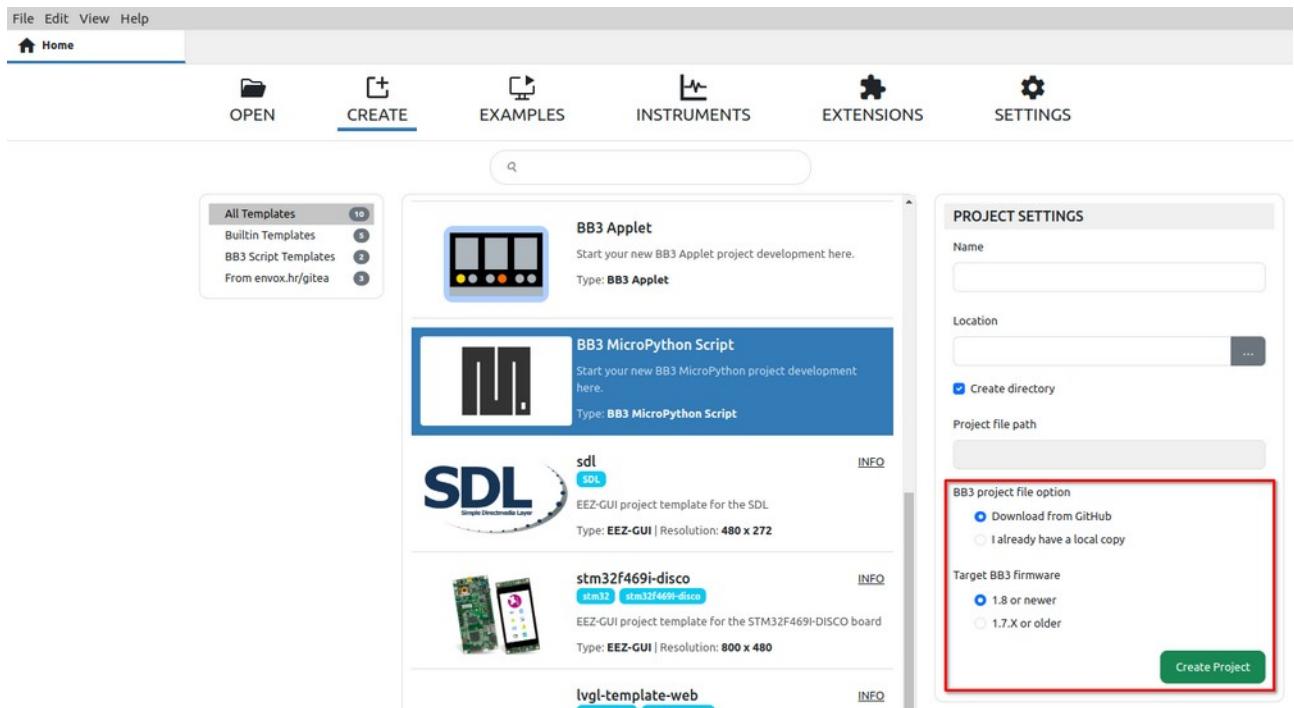

Fig. 4: EEZ BB3 MicroPython new project additional options

After all the basic parameters have been entered, the new project will be displayed in the project editor in *Edit* mode. Fig. 5 shows a new project for the *EEZ BB3 applet*. An overview of the project editor can be found in the next chapter.

The newly created project has the minimum required to be able to execute it in simulation (*Run* or *Debug* mode) or after build on the target platform.

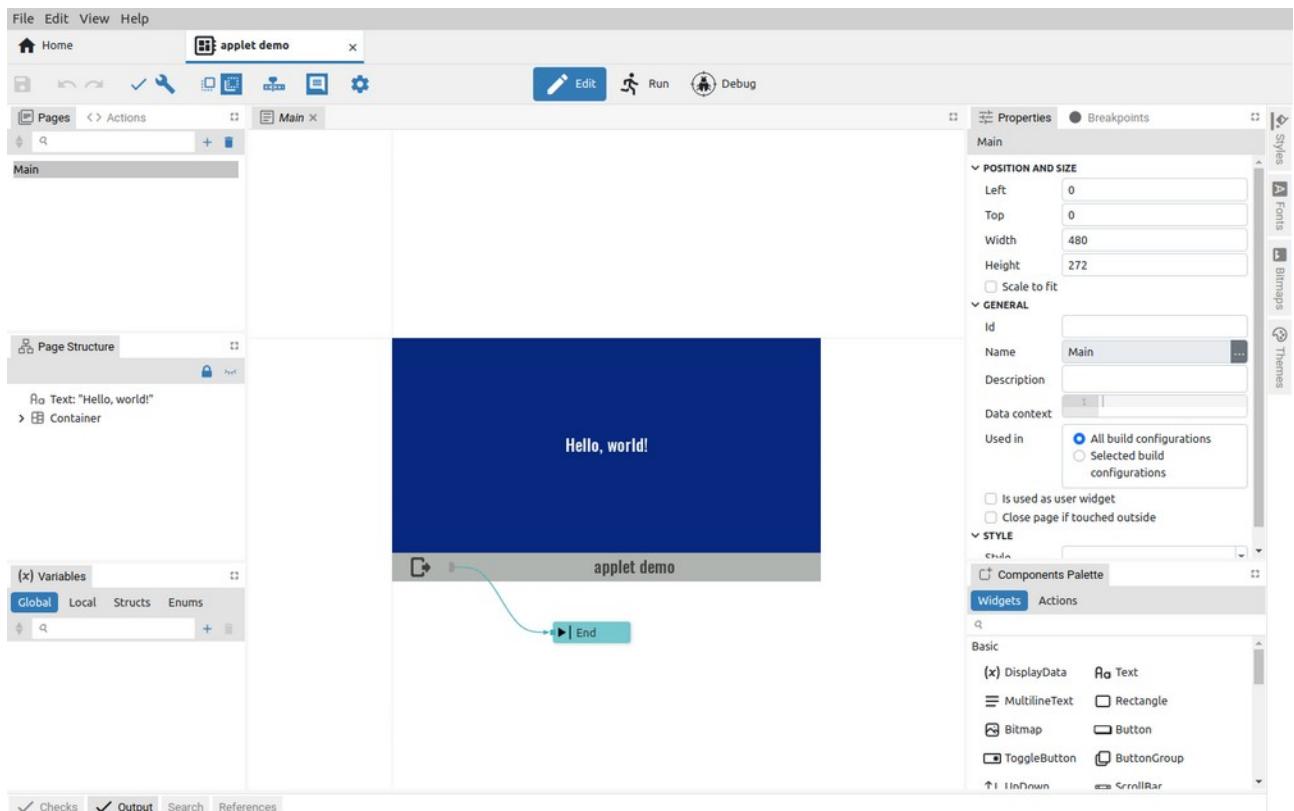

Fig. 5: Newly created project in Edit mode

The basic project settings set by the New project can be seen by clicking on the *Settings* option (1)

when the project *Settings* will open in a new tab (2) as shown in Fig. 6.

There you can also see *Project features* that have been added and are mandatory, so the *Remove* option is disabled (3), added and can be removed (4) and others that have not yet been added (5).

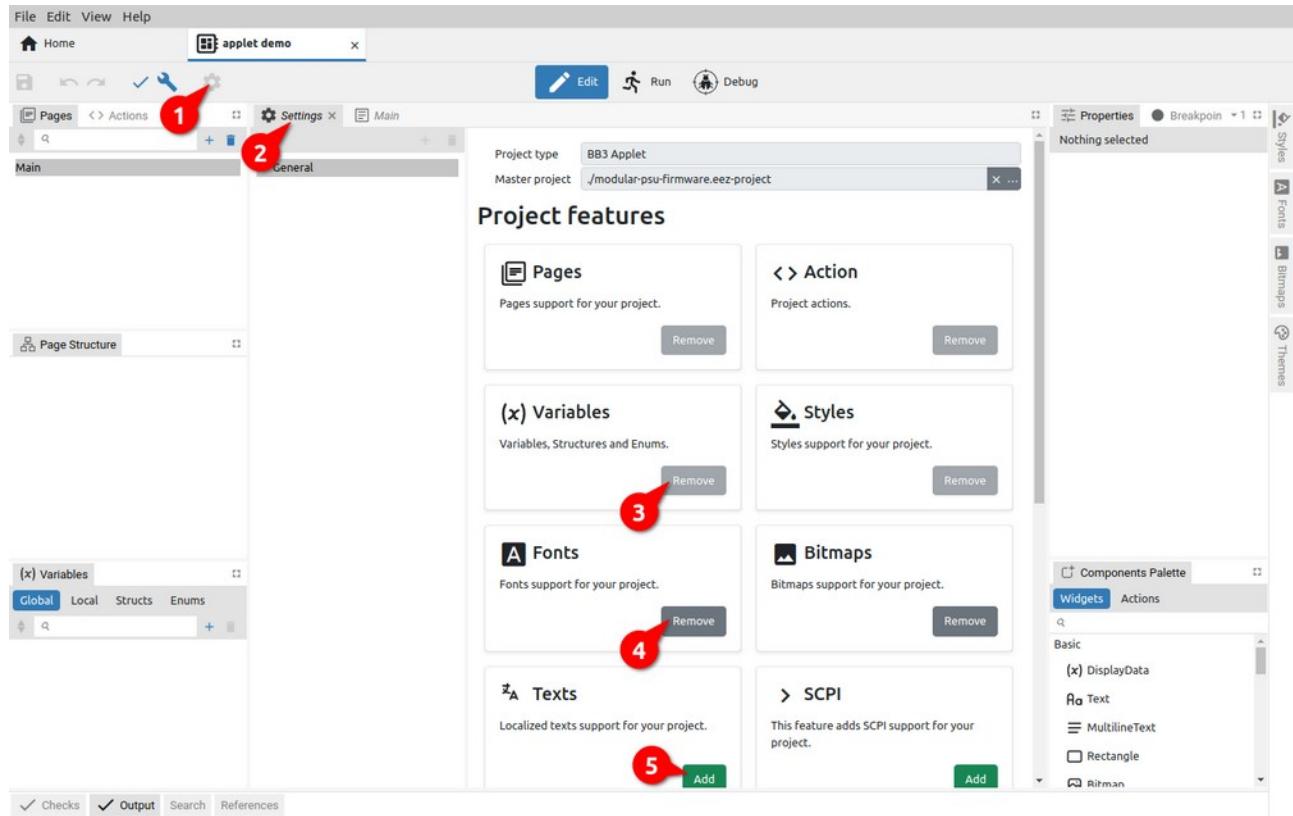

Fig. 6: Newly created project settings

## P2. Project editor overview

This chapter provides an overview of the basic elements and functions of the Project editor. Their detailed description and content is described in other chapters.

### P2.1. Project editor workspace

Fig. 7 shows a typical arrangement of Project editor elements. Thanks to its modern design, the Project editor offers users the freedom to rearrange them according to their own needs and taste.

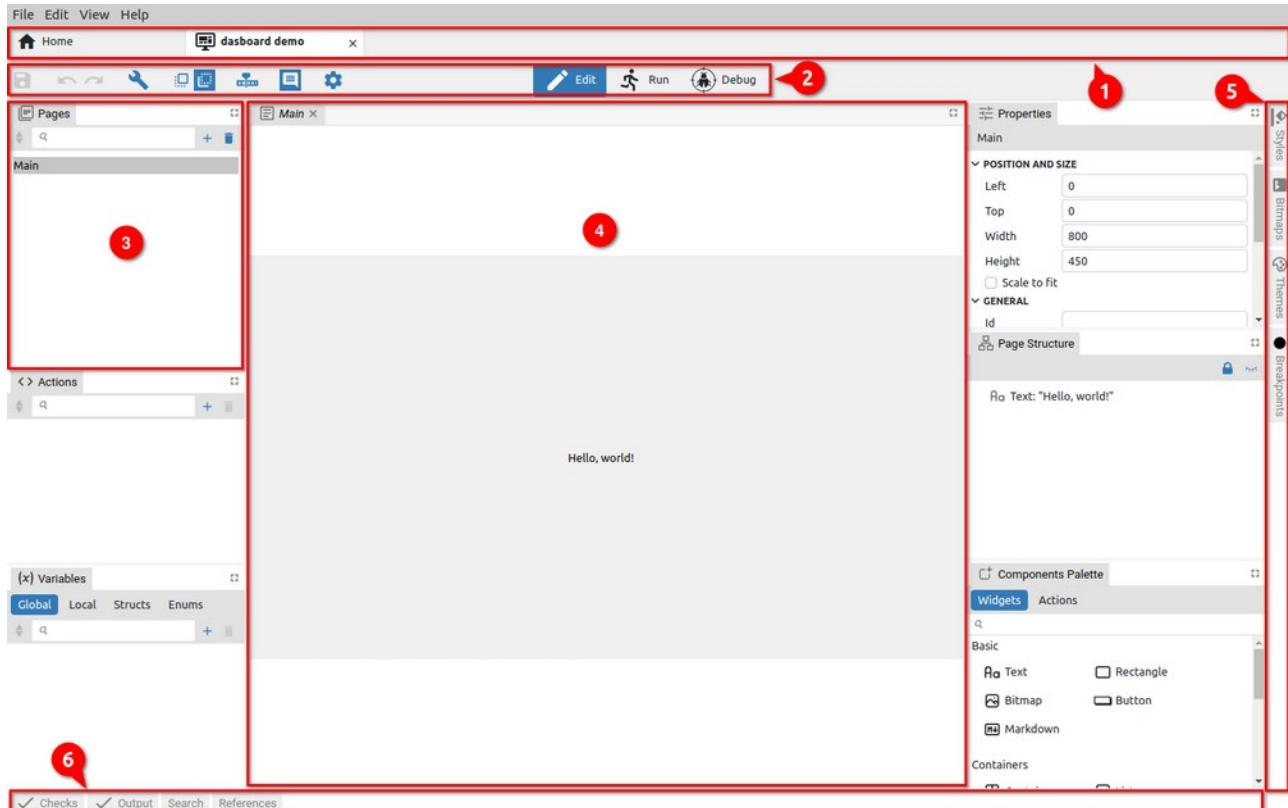

Fig. 7: Project editor sections

All elements of the project editor can be classified into three main groups:

- *Toolbar* – contains icons of basic editor functions, the number of which varies depending on the type of project.
- *Panel windows* – can contain groups of project elements, components and reports e.g. *Pages*, *Actions*, *Styles*, *Fonts*, *Bitmaps*, *Variables*, *Checks*, *Output (Build results)*, *Search* and *References*. Panels can be grouped within a tabs when they are accessible via tabs labeled with their names.
- *Page editors/viewers* is used to display the page being edited (*Page editors* in Debug mode are *Page viewers* because then the content of the page cannot be edited).

Panels and editors can be grouped within one or more tabs. Tabs are dockable and can be placed in the workspace e.g. (3) and (4) or along borders e.g. (5) and (6). The elements of the project editor shown in Fig. 7 are explained below.

#	Section / option	Description
1	<i>Main tabs</i>	Allows easy navigation between multiple open projects (as well as other options that do not belong to the <i>Projects</i> section, i.e. instruments, etc.).
2	<i>Toolbar</i>	List of the main functions of the Project editor and modes ( <i>Edit</i> , <i>Run</i> and <i>Debug</i> ).
3	<i>Tabset</i>	A dockable section that contains one or more panels.

#### 4 Editor tabset

The place where Pages and Actions are edited. Unlike Actions, Pages also contains GUI elements (Actions can only contain program logic created in EEZ Flow).

#### 5 Right border tabset

An example of a border tabset placed along the right border. By default, it contains panels for styles, bitmaps, themes and breakpoints.

#### 6 Bottom border tabset

An example of a border tabset placed along the bottom border. By default, it contains panels for error checking, build and search lists.

### P2.2. Display of the page in the editor

In Fig. 8 shows how it is possible to work with multiple editors. To display a page in the editor, click on the desired page (1). A new editor tab will appear, with the name of the selected page in italics (2). This indicates that the tab is not locked and if you choose another page from the list, it will replace the currently displayed one. If we want to lock the page, we will use the right click when the option *Keep Tab Open* (3) will appear. When the page is locked, its name will no longer be displayed in italics (4).

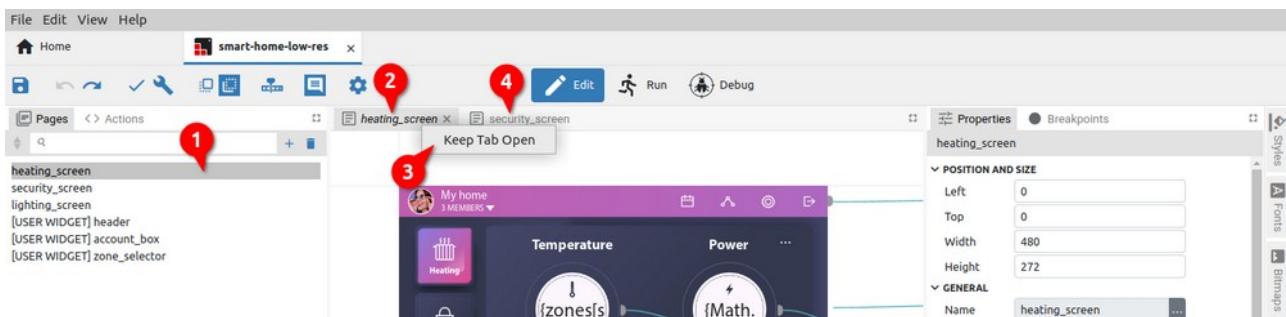

Fig. 8: Page editor tab locking

### P2.3. Panel moving and docking

Panels and editors can be freely positioned within the workspace or borders and grouped into tabsets.

The key difference between panels and editors is that panels cannot be closed/hidden, unlike editors that open and close as needed depending on how many pages we want to have in the workspace.

Below is an example of how to move the *Actions* panel to another tabset. To begin, click and hold the *Actions* tab (Fig. 9).

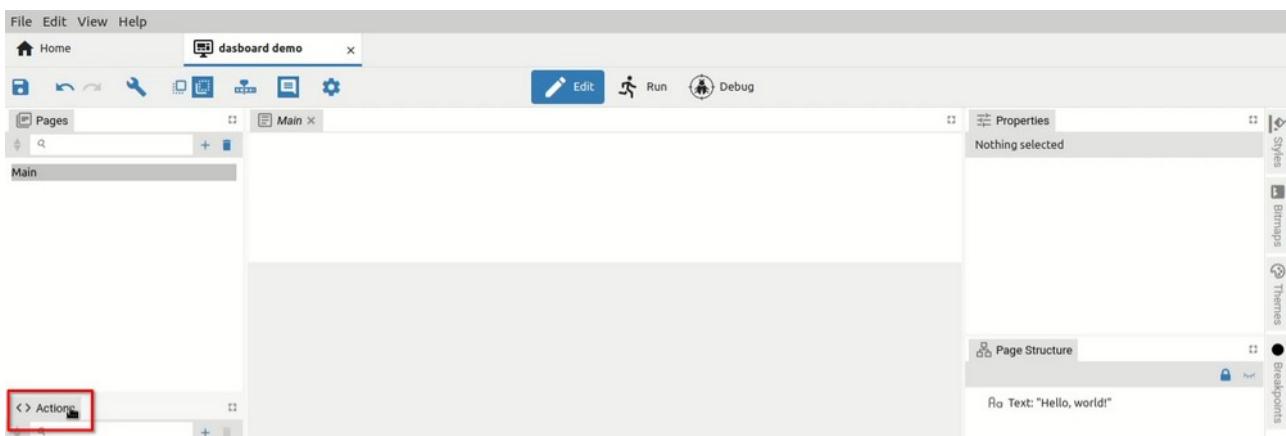

Fig. 9: Panel selection

The panel is now ready to move to another location. The cursor will change and marks will also appear on all four sides indicating the ability to dock into border tabs (Fig. 10).

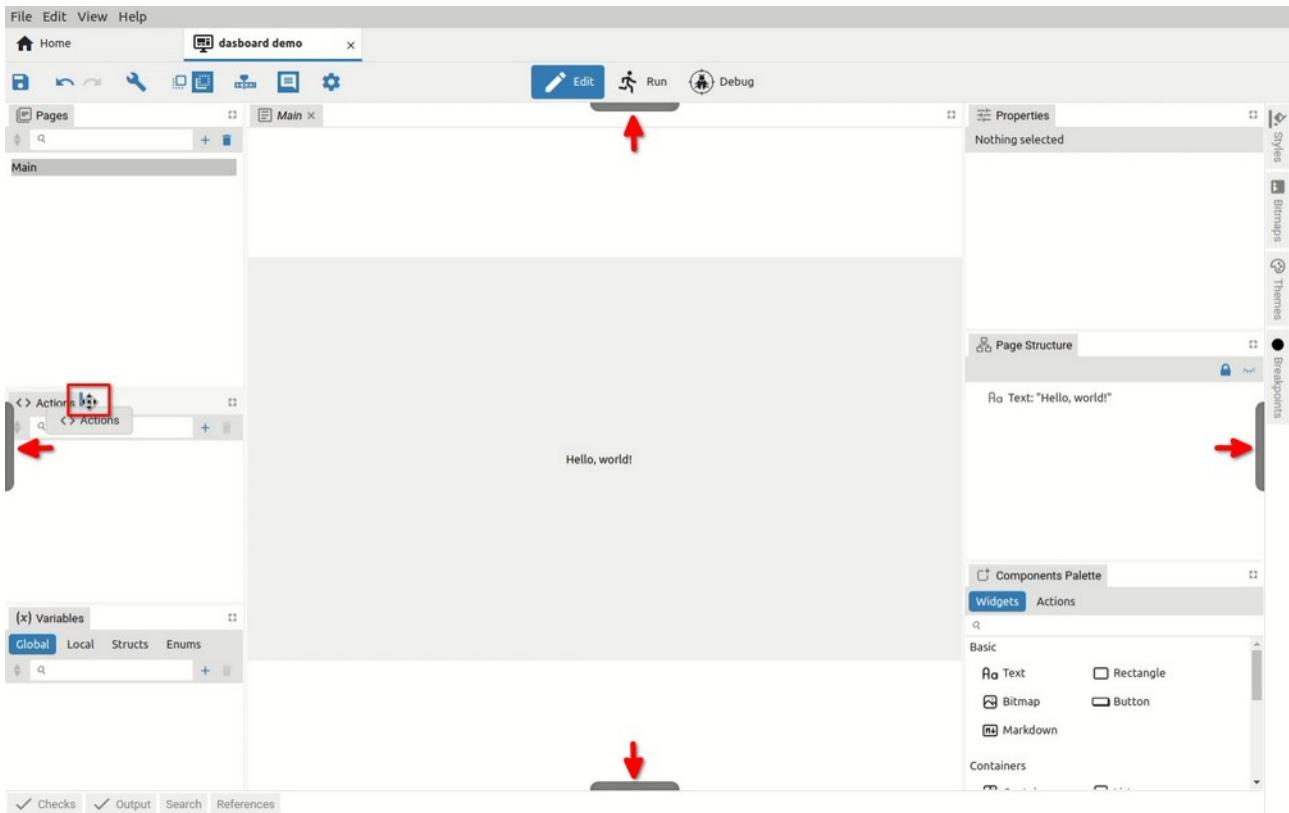

Fig. 10: Docking indicators for border tabs

Now we can choose where we want to dock the panel and whether we want it to become a new tab in the tabset or share the space occupied by an existing tabset. For example, if we want the selected panel to share horizontally the lower part of the space occupied by *Pages*, we will need to move the cursor to the lower part of the *Pages* panel when a rectangle will be displayed as in Fig. 11. Similarly, if we want the selected panel to divide vertically the right part of the space occupied by *Pages*, we will need to move the cursor to the right part of the *Pages* panel until a rectangle is displayed as in Fig. 12.

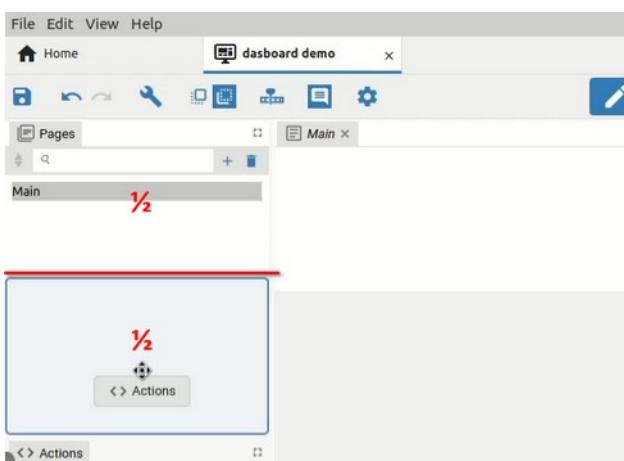

Fig. 11: Panel horizontal positioning

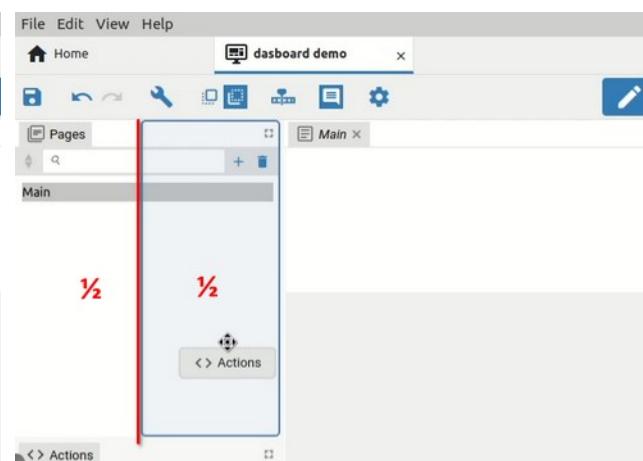

Fig. 12: Panel vertical positioning

The panel can also become a new tab within the existing tabset. This can be done in two ways: by moving the cursor next (left or right) to the existing tab in the tabset as shown in Fig. 13 or to place the cursor approximately in the middle of the existing tab so that a rectangle appears as in Fig. 14.

*Note: if we move the cursor closer to the edges of the existing tab, smaller rectangles will appear indicating that the space of the existing tab will be split as shown in Fig. 11 and Fig. 12.*

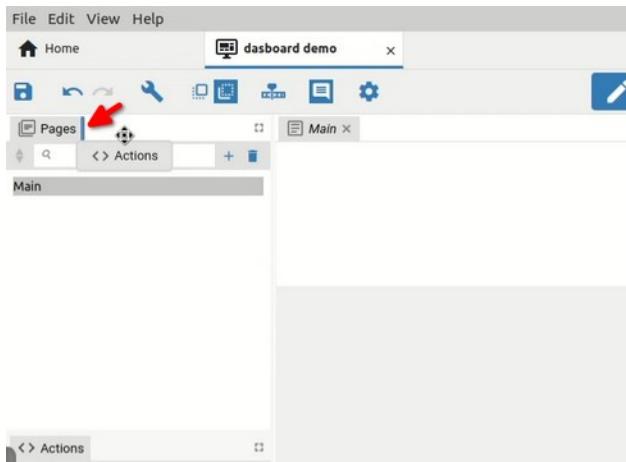

Fig. 13: Positioning in another tabset (1<sup>st</sup> method)

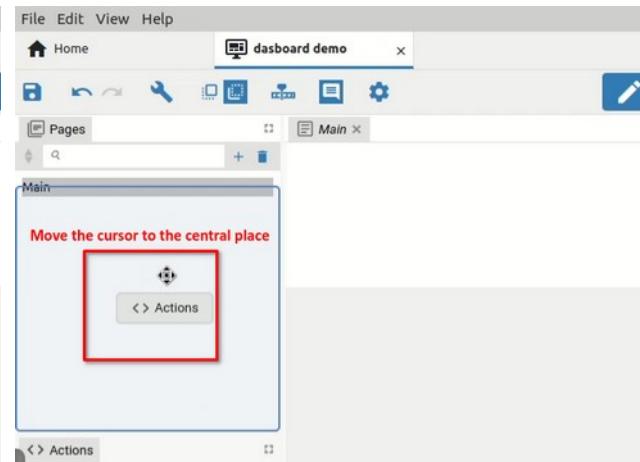

Fig. 14: Positioning in another tabset (2<sup>nd</sup> method)

Finally, when we have chosen where we want the selected panel to be displayed for docking, it will be necessary to release the mouse button. In our example, Actions will become a new tab in the tabset with Pages (Fig. 15).

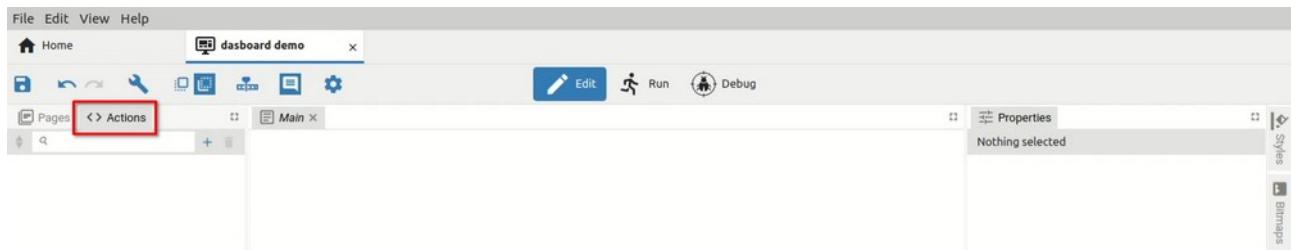

Fig. 15: Panel docking completed

#### P2.4. Border tabssets

Panels from border tabssets, unlike panels in the workspace, are displayed by clicking the tab (Fig. 16) and closed by clicking the tab again. Only one panel within a border tabset can be open at any time (Fig. 17).

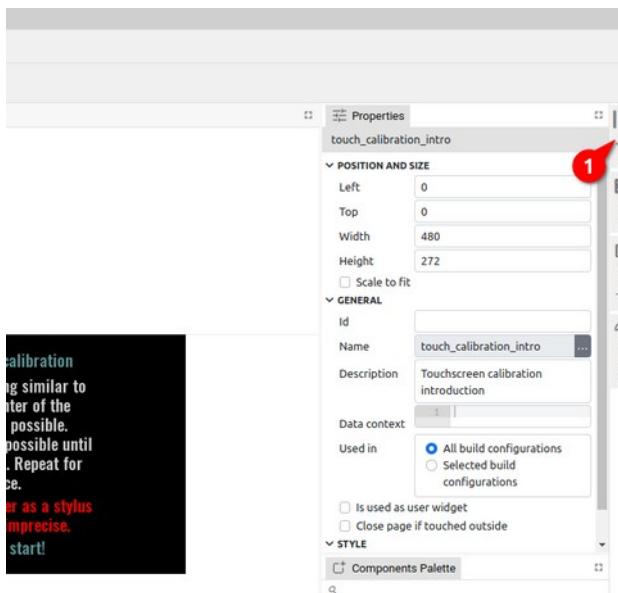

Fig. 16: Border tabs are closed

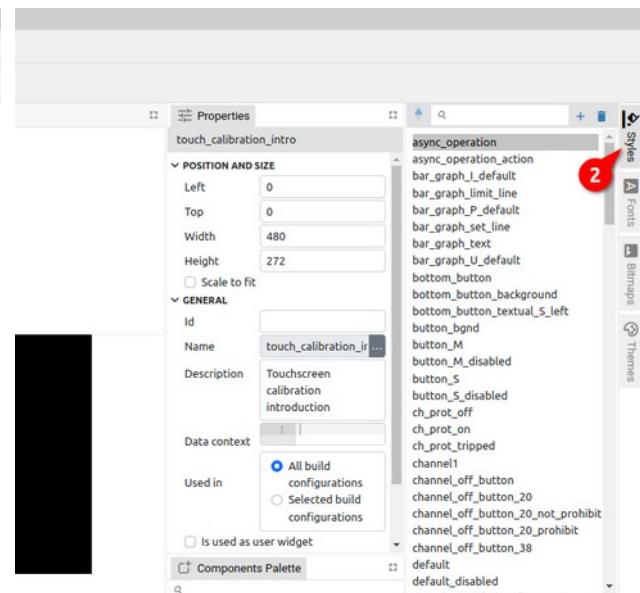

Fig. 17: The border tab is selected and opened

Panel docking is possible in Edit and Debug mode, but in Debug mode it is not possible to dock into border tabssets.

## P3. Project editor modes

Project editor has three modes: *Edit*, *Run* and *Debug*. The mode selection buttons (i.e. the Mode switcher) are located in the toolbar of the Project editor and will only be displayed if EEZ Flow is used in the project.

While the *Dashboard* project type includes EEZ Flow by default, for *EEZ-GUI* and *LVGL* projects it will be necessary to explicitly set whether or not to use EEZ Flow. To add EEZ Flow to such projects, use the *Flow support* option (Fig. 18).

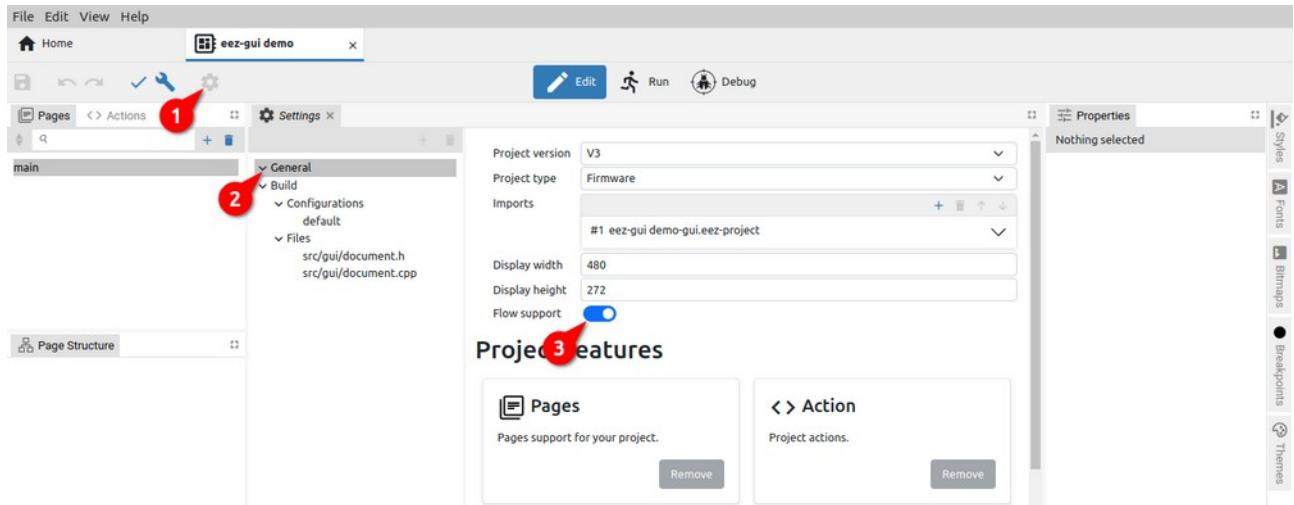

Fig. 18: Enabling EEZ Flow in project Settings

### P3.1. Toolbar overview

The appearance of the Toolbar depends on the Project editor mode. Certain options are common to all modes, while some depend not only on the current mode but also on the selected *Project features* in *Settings* or the use of global variables when their status will be displayed.

Fig. 19 shows the toolbar with all options displayed. Their availability in each mode is shown in Table 1.

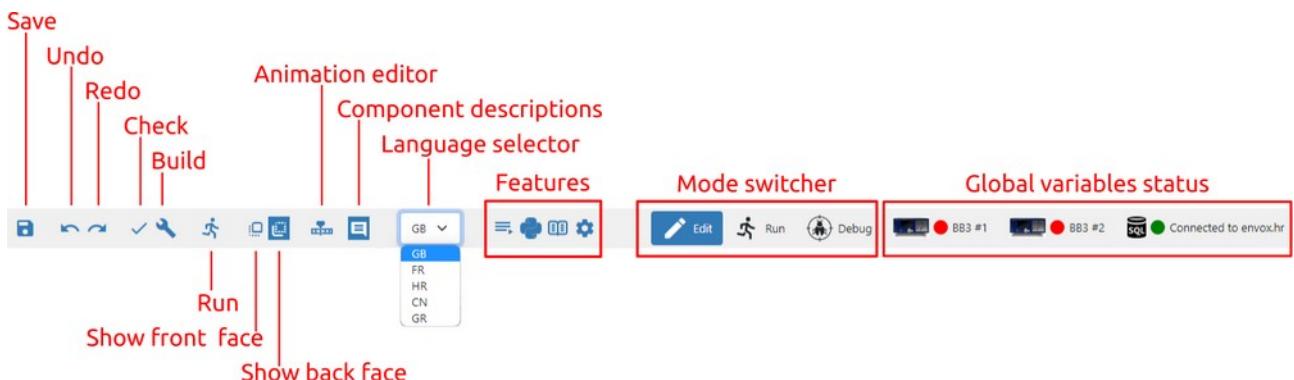

Fig. 19: Project toolbar (all options)

What editors are in *Edit* mode, viewers are in *Run* and *Debug* mode. So we have Page viewer (in *Run* and *Debug* mode) and Action viewer (*Debug* mode only). For example, page viewer displays the page in the same way as the editor, but editing is not possible.

When the Project editor is in *Run* mode, it displays only the toolbar and the active page viewer.

In *Run* and *Debug* mode, it is not possible to change the project, but only to monitor the execution of the project.

Statuses of global variables are present only in *Run* or *Debug* mode and if the project has at least one global variable of type *object*, e.g. *Instrument connection* or *PostgreSQL connection*. Status shows icon, connection state (connected / disconnected) and title. By clicking on the status of the global variable, you can e.g. change the connected instrument or PostgreSQL connection parameters.

Function / Group	Edit	Run	Debug
Save	✓		
Undo	✓		
Redo	✓		
Check	✓		
Build	✓		
Run MicroPython Script (EEZ BB3 only)	✓		
Show front face	✓		✓

Language selector	✓		
Features	✓		
Mode switcher	✓	✓	✓
Global variables status		✓	✓

Table 1: Toolbar options in all modes

### P3.2. Toolbar in Edit mode

#### Undo / Redo

Undo / Redo recent editor Action. If any changes have been made to the project since the last save, a \* sign will appear in the project tab next to the name (Fig. 20).

Fig. 20: Indication of unsaved changes

#### Check

All project elements are checked without building the executable code. The Results are displayed in the *Output* panel (Fig. 21).

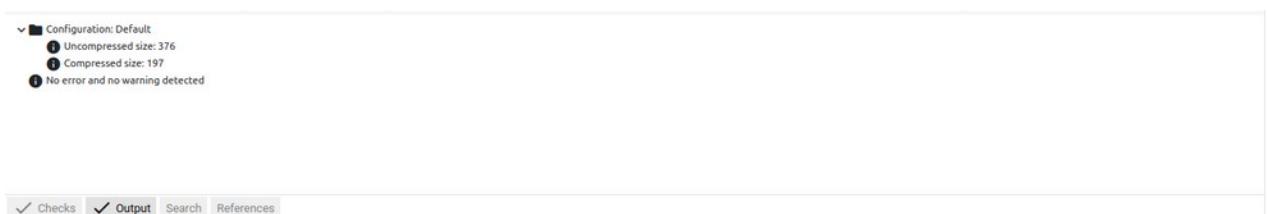

Fig. 21: Results of project checking

#### Build

Build the executable code after checking all the elements of the project. The results are displayed in the *Output* panel (Fig. 22).

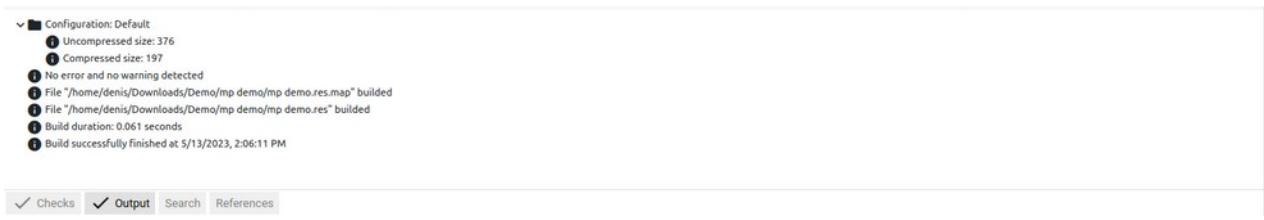

Fig. 22: Project build results

### Run MicroPython Script (EEZ BB3 only)

The option is available for a *MicroPython Script* type project that can be executed on an EEZ BB3 device. The *MicroPython* feature should also be selected in the project's general settings.

It starts the build of the project when the accompanying resource file (.res extension) is generated, which will be transferred together with the MicroPython script (.py extension) to the selected EEZ BB3 where it will be started.

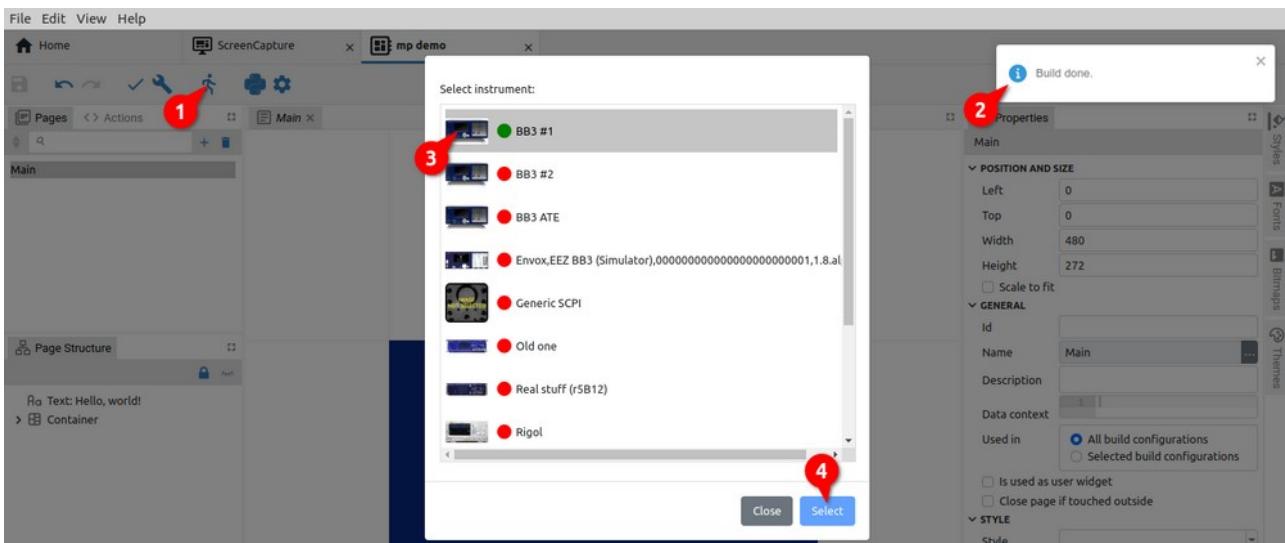

Fig. 23: Selection of target EEZ BB3 for project execution

In case there is no active connection with the selected EEZ BB3, an additional dialog box for establishing the connection will appear. For example in Fig. 24 the serial interface is selected.

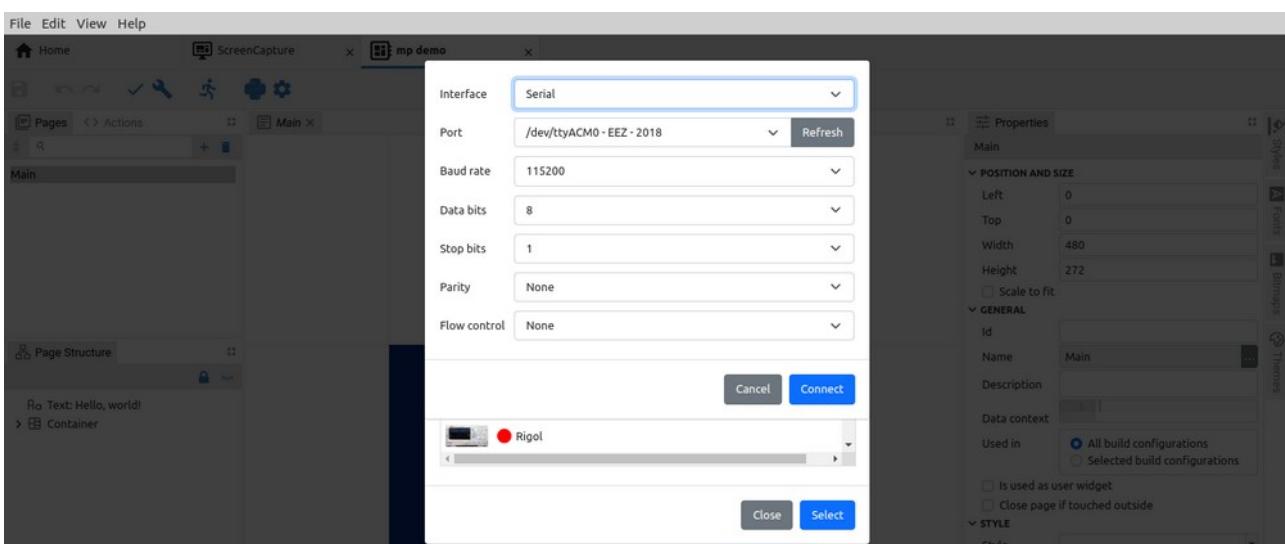

Fig. 24: Selection of target EEZ BB3 for project execution

Finally, after the project files (.py and .res) have been successfully transferred to the selected EEZ BB3, an indication will appear when the MicroPython script has been started (Fig. 25).

Fig. 25: Project execution indication

## Show front face

Shows only Widgets without Action components and lines in the page editor for better readability. This button is present if EEZ Flow is enabled in the project and if the page editor is in focus (Fig. 26).

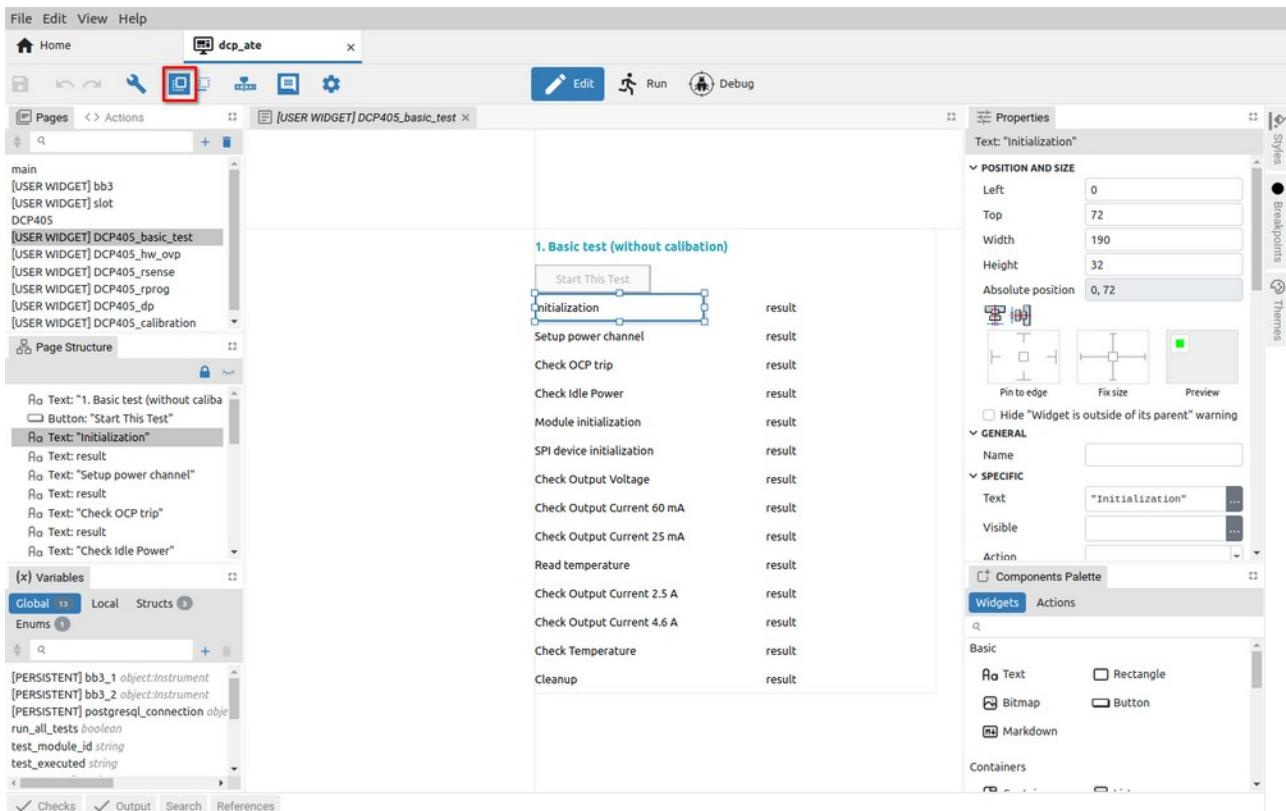

Fig. 26: Project page in front face view

## Show back face

Shows all components (both Widgets and Actions) and lines in the page editor. This button is present if Flow is enabled in the project and if the page editor is in focus (Fig. 27).

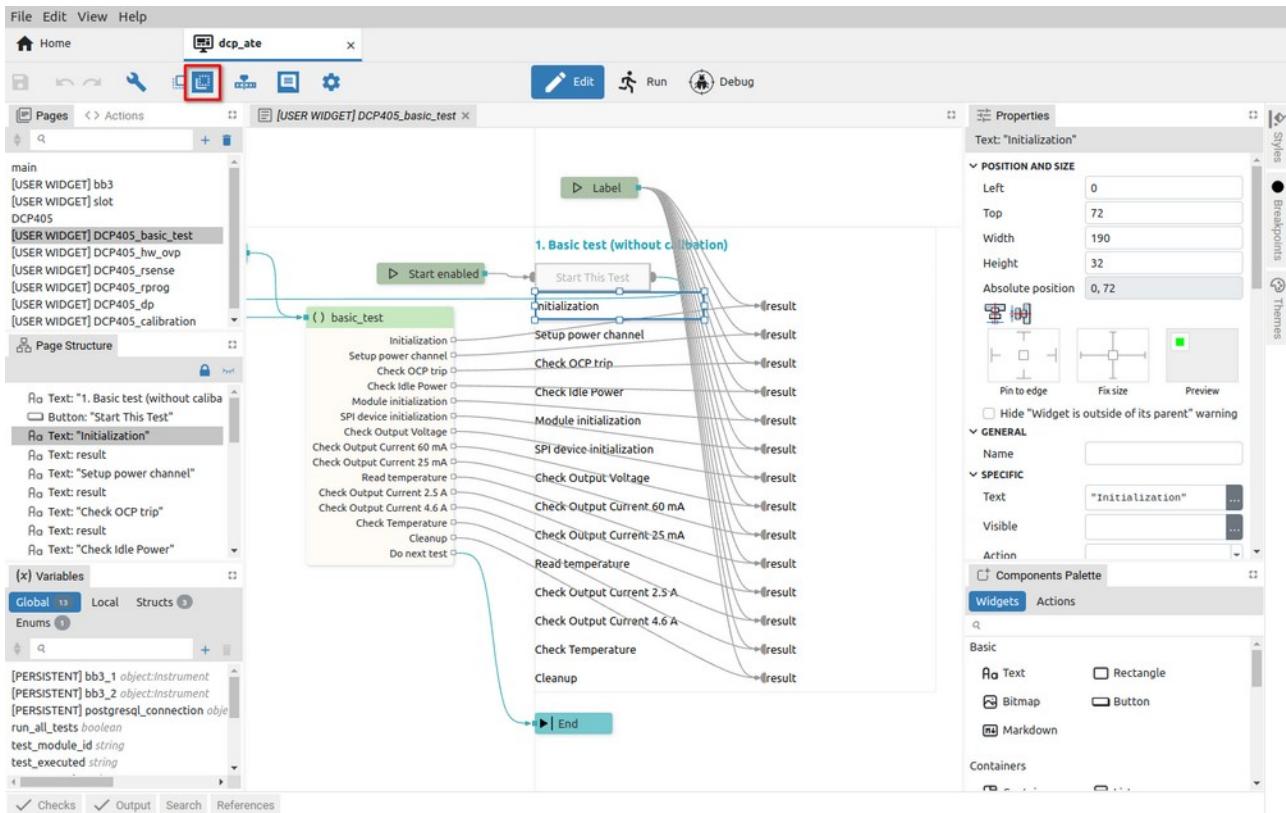

Fig. 27: Project page in back face view

### Show / Hide animation timeline editor

EEZ Flow supports animation of page content, for which the Animation timeline editor is used.

An icon in the toolbar to show and hide it will appear when the page editor is in focus. EEZ Flow should also be enabled in the general settings of the project (Fig. 17).

The animation timeline editor is displayed in the space below the page editor (Fig. 28).

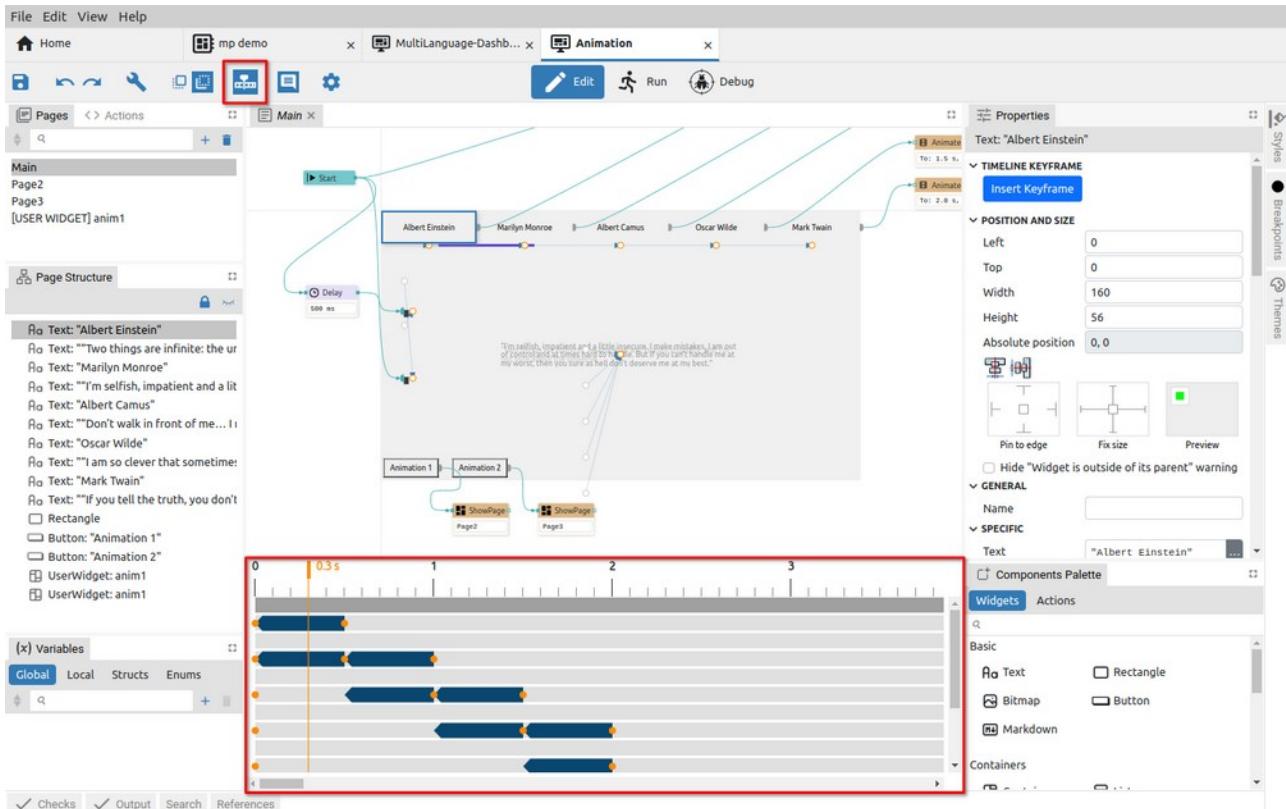

Fig. 28: Project animation timeline editor  
P.21

## Show / Hide component descriptions

Each component has a *Description* property. With this option, we choose whether the description will be seen under the component or not (Fig. 29).

The option is only displayed if the page editor is in focus and *Show back face* is selected.

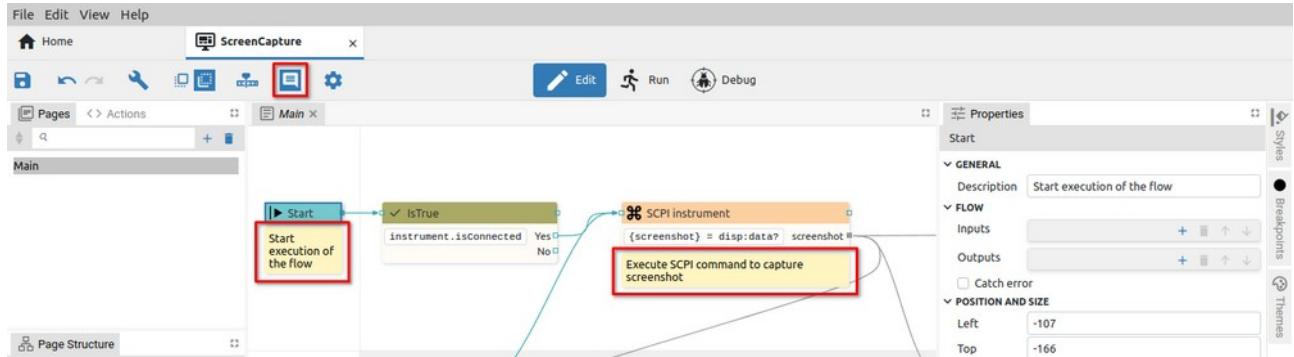

Fig. 29: Component descriptions are visible

## Language selector

This option is present in the toolbar if the *Texts* feature is selected in the project general settings and if at least one language is defined. Then the *Texts* tab will appear in the left border tabset (2), whose panel (3) contains definitions of multilingual text strings, used languages and translation statistics. The texts displayed in the page editor will be displayed in the language selected in the language selector of the toolbar (1). In the example in Fig. 30 French (FR) is selected.

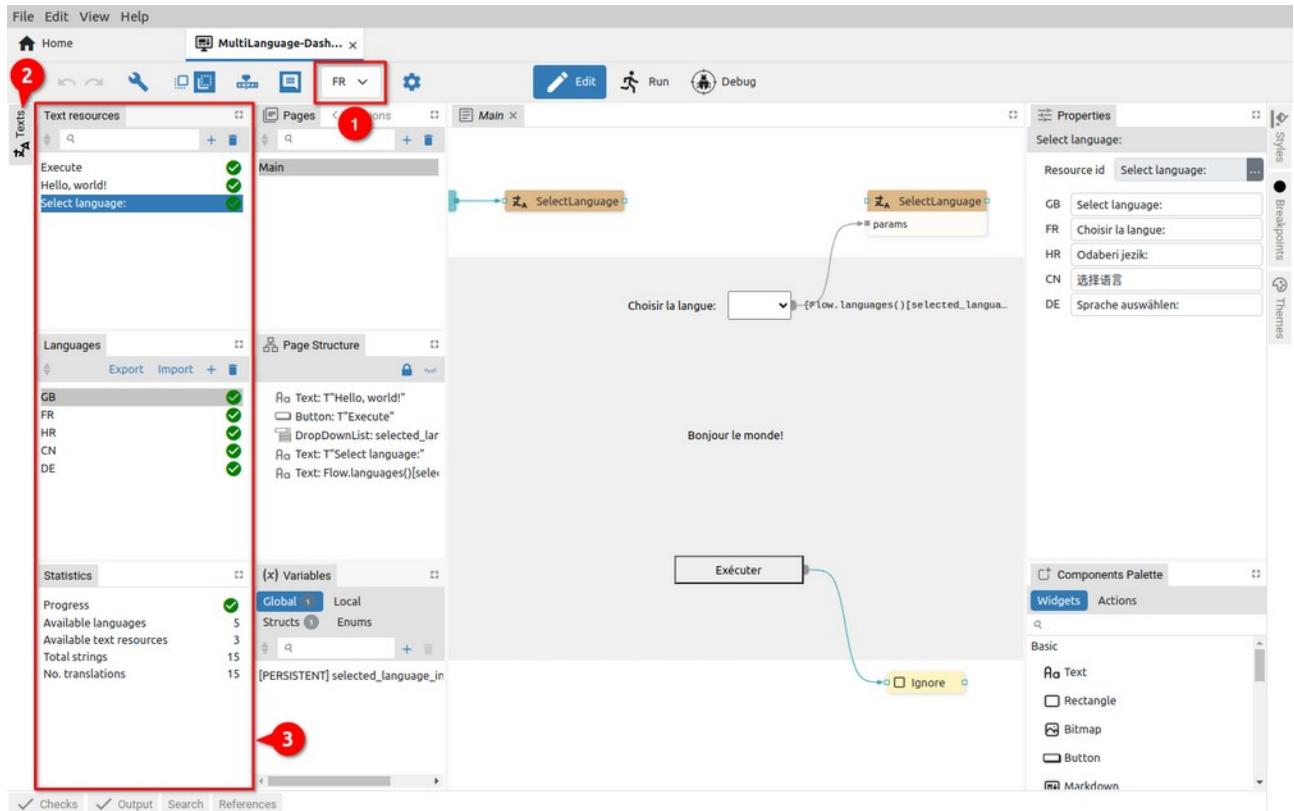

Fig. 30: Project language selector

### P3.3. Feature buttons

The following project features when selected in the project general settings will add an icon to the toolbar: *Shortcuts*, *MicroPython* and *Readme*. Project *Settings* also has its icon in the toolbar. The mentioned features, when selected, are displayed in the project editor as described in Chapter XX.

## P4. Project editor panels

### P4.1. Panel items

Panel items are marked in Fig. 31 and described below. As you can see, different panels can have different number of items.

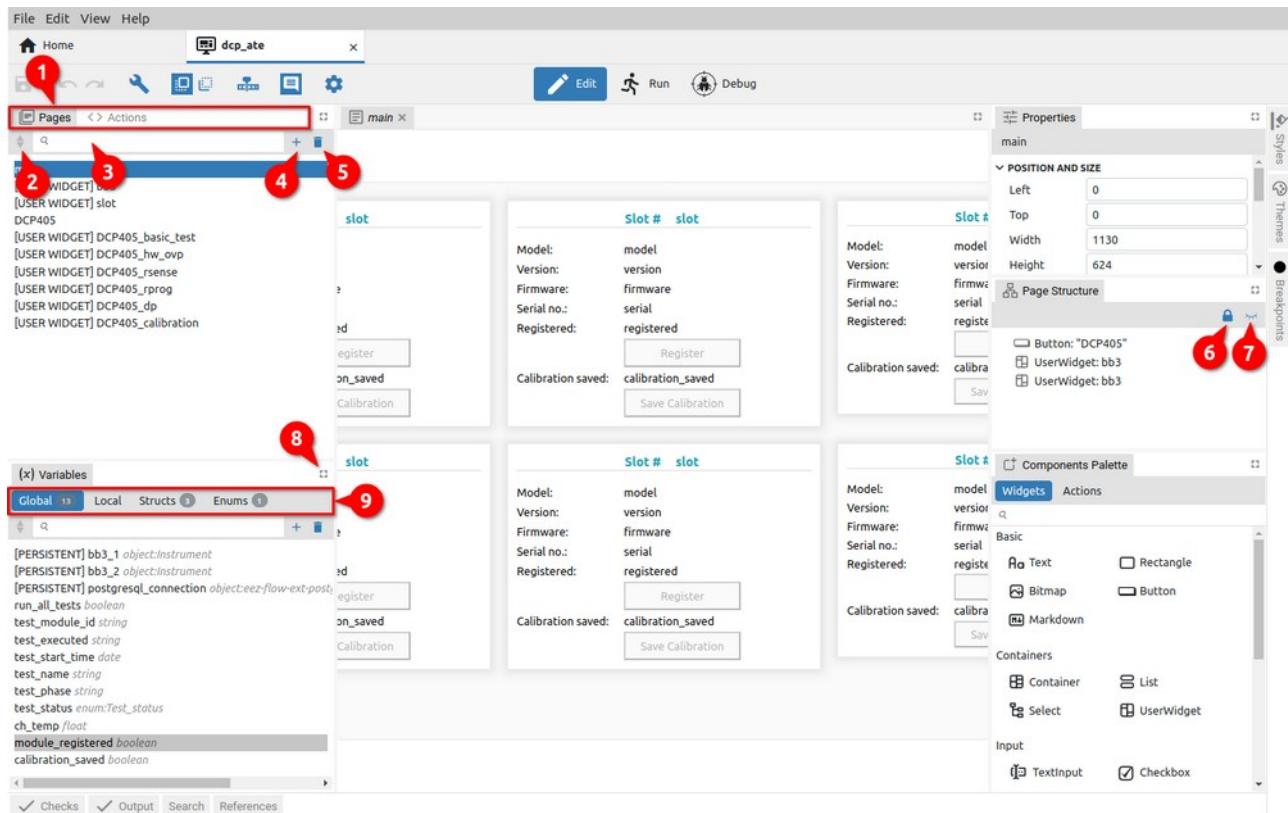

Fig. 31: Panel items

#### # Item

- 1 *Panel tabs*
- 2 *Items sort order*

#### Description

Selecting panels within a tabset.

Toggle between three sort states: User (both arrows inactive), Ascending (upper arrow active) and Descending (lower arrow active). When the user sort order is selected, which is the default, it is possible to change the position of the item in the list. For that, you need to click and hold on the item you want to move (1), when the appearance of the cursor will change and the background of the item name will change. By moving the cursor, an indication of the new position of the item will be displayed (2) and finally, when the mouse button is released, the item will appear in the new location (3).

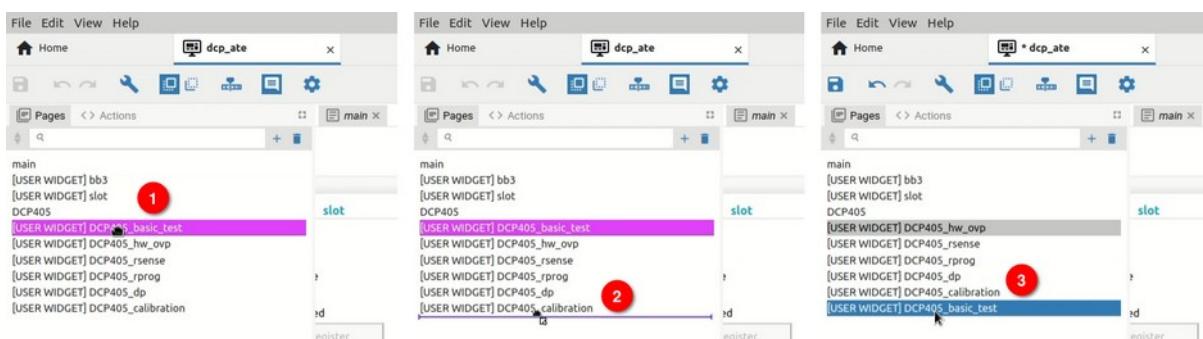

Fig. 32: Changing item position

**IMPORTANT:** make sure that the first page in the list is the one you want to be attached first when starting the project. The name of the page can be arbitrary (main in the example in Fig. 32).

- |                      |  |
|----------------------|--|
| 3 <i>List filter</i> | Filtering items in the list according to the search term.<br>If something is entered in the list filter box, then drag & drop in the list of items is disabled when User sorting order is selected.                          |
| 4 <i>Add item</i>    | Adding a new element to the panel. Opens a new dialog box with one or more parameters depending on the type of item. The name of the new item must be unique. Example in Fig. 33 shows the dialog box for adding a new page. |

**IMPORTANT:** The page name must not contain a dot (.) because when importing, the dot is used as a separator between the name of the external library and the page name.

Fig. 33: Adding a new item (Page)

- |                                    |   |
|------------------------------------|---|
| 5 <i>Delete selected item</i>      | Deleting the selected element from the panel. A deleted item can be restored with <i>Undo</i> option in the Toolbar.  |
| 6 <i>Lock All / Unlock All</i>     | Lock / Unlock all panel elements.   |
| 7 <i>Hide All / Show All</i>       | Hide / Show all panel elements.   |
| 8 <i>Maximize tabset / Restore</i> | Maximizing tabset display. When maximized, that icon is replaced by <i>Restore</i> .  |
| 9 <i>Sub tabs</i>                  | Certain panels of the Project editor, e.g. <i>Components Palette</i> or <i>Variables</i> use their tabs to organize content. These are displayed as sub-tabs within a tabset. |

#### P4.2. Right-click menu

Right-click opens a context menu that generally contains options as in Fig. 34. The right-click menu for Widgets (Fig. 35) has a few more options and will be described in Chapter P7.2.2.

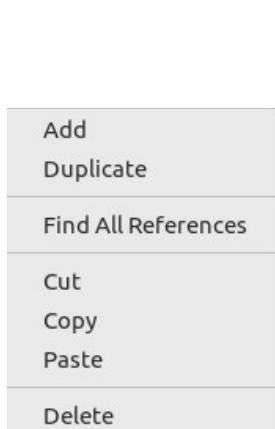

Fig. 34: Right-click menu (common)

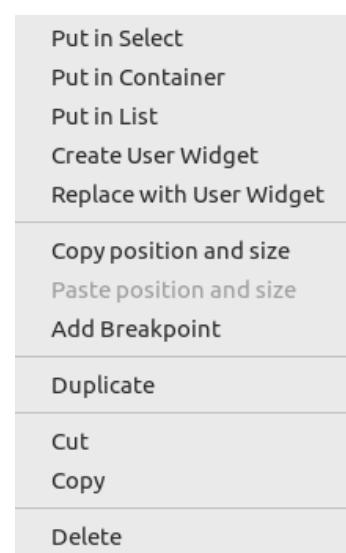

Fig. 35: Right-click menu (Widgets)

Option	Description
Add	Adding a new item. See the description in the previous subsection.
Duplicate	Duplication of items in the list. The name of the duplicated item will be given a numerical suffix: for example, <i>main</i> will be duplicated in <i>main-1</i> .
Find All references	Finding all references to the selected item. The results are displayed in the References panel. Clicking on the reference leads to the place in the project where the item is used.

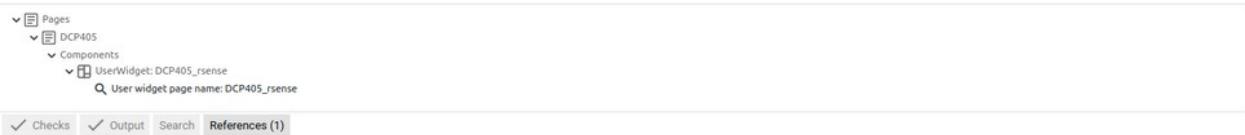

Fig. 36: Displaying the results of the Find all references operation

Cut	Cut (remove) item from list and copy it to clipboard.
Copy	Copy item to clipboard.
Paste	Adding items to the list from the clipboard. This option is hidden if the clipboard is empty.
Delete	Deleting the selected element from the panel. A deleted item can be restored with <i>Undo</i> option in the Toolbar.

### P4.3. Edit mode panels overview

Panel	Description
Pages	Pages that will be able to be displayed in the GUI. The page at the top of the list will be the first to be displayed at runtime. Pages opened in the tabset editor can be edited.
Actions	Project Actions created in EEZ Flow.
Page structure	List of all Widgets used in the currently selected page in the editor.
Variables	Global and Local variables. Definitions of <i>Structs</i> and <i>Enums</i> types.
Properties	Display and edit properties of the selected item.
Breakpoints	List of all breakpoints where it is possible to enable / disable individual breakpoints.
Components Palette	List of all Widgets and Actions that can be added to a page or Action. The project type determines which Widgets and Actions will appear in the palette.
Styles	All styles for GUI elements.
Themes	Themes are used to easily switch styles and thus change the GUI appearance. When creating a new theme, all styles that currently exist will be added to the new theme.
Bitmaps	List of all imported bitmaps. It will be displayed if the <i>Bitmaps</i> feature is enabled in the project general settings. Bitmaps cannot be edited in the project editor.
Fonts	List of all imported fonts. It will be displayed if the <i>Fonts</i> feature is disabled in the project general settings. The project editor enables basic editing of fonts.
Texts	Localizing texts for multilingual GUI. It will be displayed if the <i>Texts</i> feature is disabled in the project general settings. The localization of the texts is described in Chapter P12.
IEXT (EEZ-GUI only)	Definition of IEXT extension. It will be displayed if the <i>IEXT defs</i> feature is disabled in the project general settings. One project can define multiple IEXT extensions. The IEXT creation procedure is described in Chapter XX.

<i>SCPI (EEZ-GUI only)</i>	List of SCPI commands that will be accessible in IEXT. It will be displayed if the <i>SCPI</i> feature is disabled in the project general settings.
<i>Shortcuts (EEZ-GUI only)</i>	List of Shortcuts that will be accessible in IEXT. It will be displayed if the <i>Shortcuts</i> feature is disabled in the project general settings.
<i>Changes</i>	List of all commits if the project is in a git repository. It will be accessible if the <i>Changes</i> feature is disabled in the project general settings.
<i>Checks</i>	The project editor is constantly looking for errors in the project (e.g. wrong expressions) in the background, and the errors found will be listed in this panel.
<i>Output</i>	It shows the report after the build is complete and the errors found.
<i>Search</i>	Content search and replace. See Section P4.3.1
<i>References</i>	The following items can be found where they are all used in the project: Variables, Struct, Enum, Page, Action, Style, Font, Bitmap. Right click on the object and "Find all references", the found references will be displayed in this panel (see Fig. 36).

#### P4.3.1. Search and Replace

The *Search* panel allows you to search for a project according to the given criteria with the replace option.

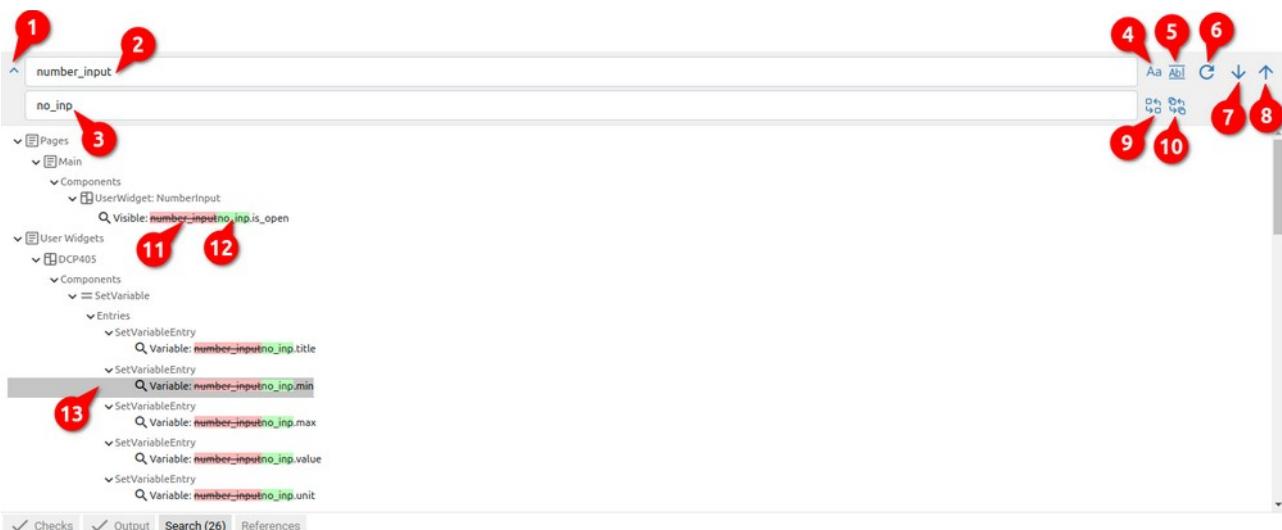

Fig. 37: Search and Replace panel

#	Item	Description
1	<i>Toggle Replace</i>	Shows or hides the Replace field (3).
2	<i>Search</i>	Searched content. Criteria (4) and (5) are taken into account during the search.
3	<i>Replace</i>	New content with which search content is to be replaced.
4	<i>Match Case</i>	Searching for case-correct content.
5	<i>Match Whole Word</i>	Searching for the whole word.
6	<i>Refresh Search Result</i>	Refreshing the results after changing the criteria.
7	<i>Next Result</i>	Move to the next result in the found list.
8	<i>Previous Result</i>	Move to the previous result in the found list.
9	<i>Replace Selected</i>	Content replacement only for the selected item from the found list.
10	<i>Replace All</i>	Content replacement for all items from the found list.
11	<i>Original content</i>	Mark of the original content that will be replaced by the new one.

- 12 *Replaced content* Mark of newly added content.
- 13 *Selected item* The currently selected item that can be replaced using option (10) or from which it can be moved to the next item with option (7) or the previous (8) item in the list.

#### P4.4. Debug mode panels overview

<b>Panel</b>	<b>Description</b>
<i>Pages</i>	Display of all project pages without the possibility of editing.
<i>Actions</i>	Display of all project Actions without the possibility of editing.
<i>Active Flows</i>	List of active Flows.
<i>Watch</i>	Display of all variables and their current values during Flow execution.
<i>Queue</i>	Display all components queued for execution.
<i>Breakpoints</i>	List of breakpoints.
<i>Logs</i>	View logs during execution. Supported log types: <i>Fatal</i> , <i>Error</i> , <i>Warning</i> , <i>Info</i> , <i>Debug</i> and <i>SCPI</i> . It is possible to filter the display according to the given criteria.

## P5. Project editors/viewers

### P5.1. Editors

The central part of the workspace represents editors tabssets in which it is possible to edit one or more pages, project features (such as project settings, etc.) or Actions. When the EEZ Flow is enabled in the project, the editors for pages and Actions are displayed in *Edit* mode. In this chapter, you can find an overview of all editors and viewers.

#### P5.1.1. Page editor

The displayed page in editor also has two auxiliary lines that determine the left and top borders, and the starting point of the page ( $x = 0$ ,  $y = 0$ ) is at the top left (Fig. 39).

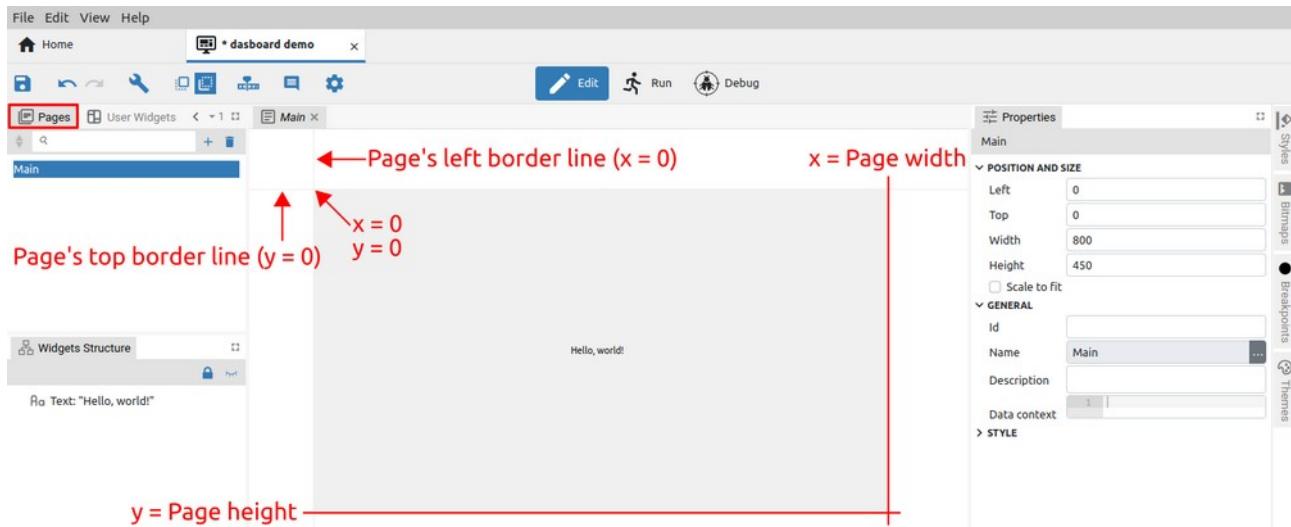

Fig. 38: Display of the page in the editor

#### P5.1.2. User Actions

The User Actions editor allows editing the selected Action from the User Actions panel (Fig. 39).

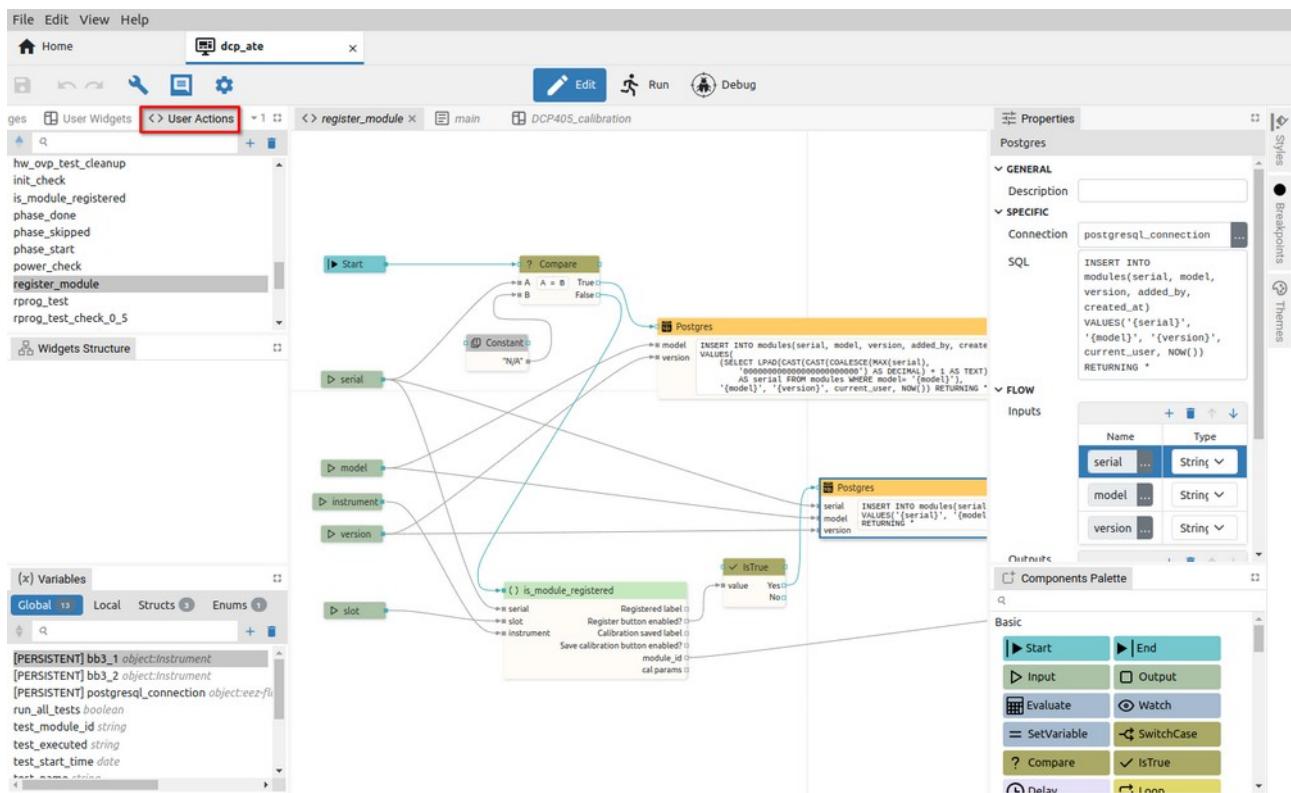

Fig. 39: User Actions editor page

### P5.1.3. User Widgets

The User Widgets editor allows editing the selected Widget from the User Widgets panel (Fig. 40).

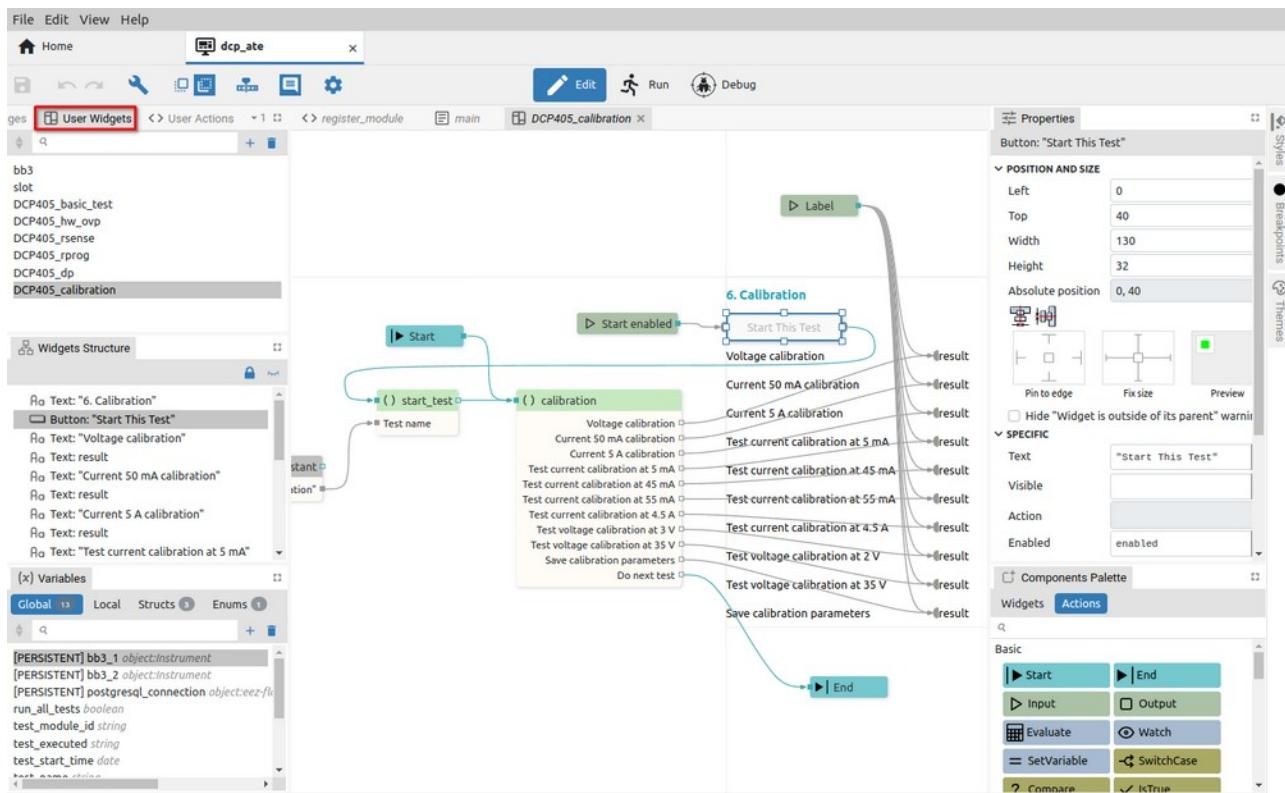

Fig. 40: User Widgets editor page

### P5.1.4. Font editor

Display of all characters in the font. It also enables the subsequent addition of a new character or the deletion of an existing one. The project will have a Fonts panel if the *Fonts* feature is selected in the project general settings.

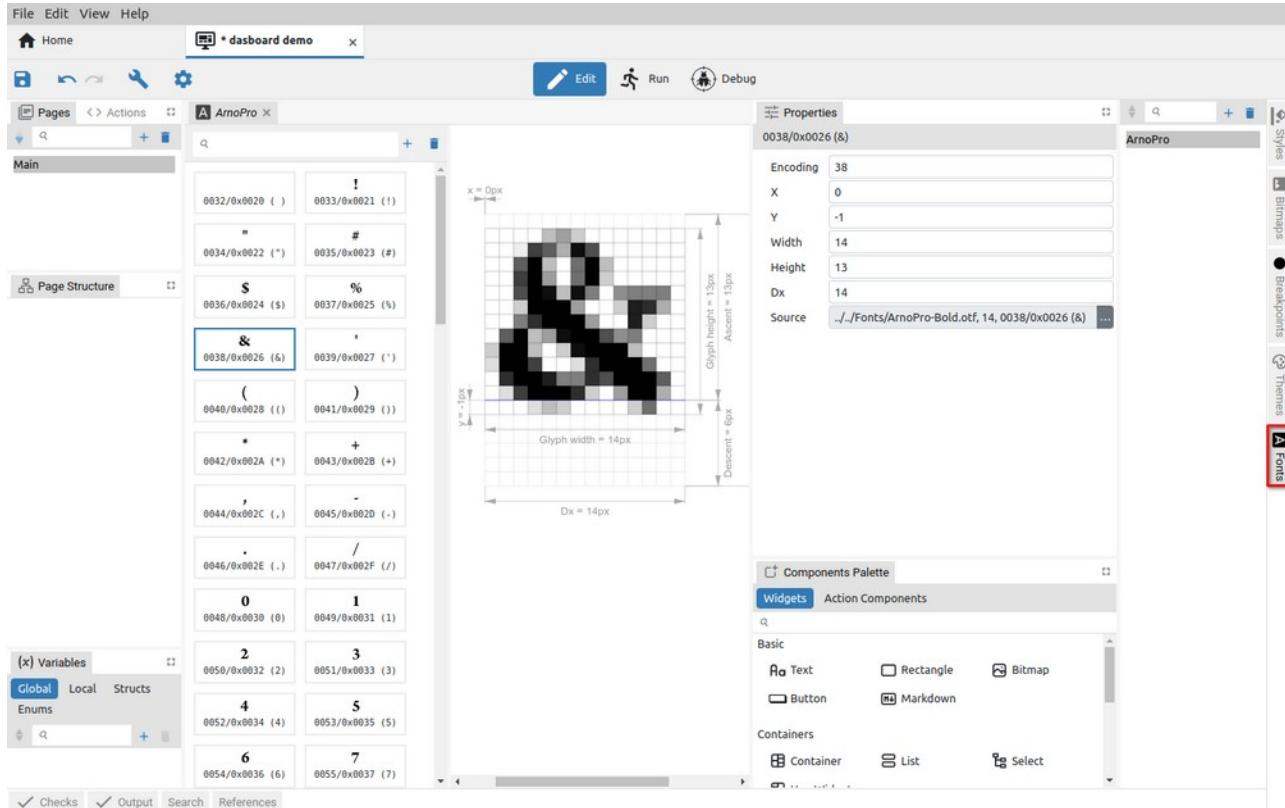

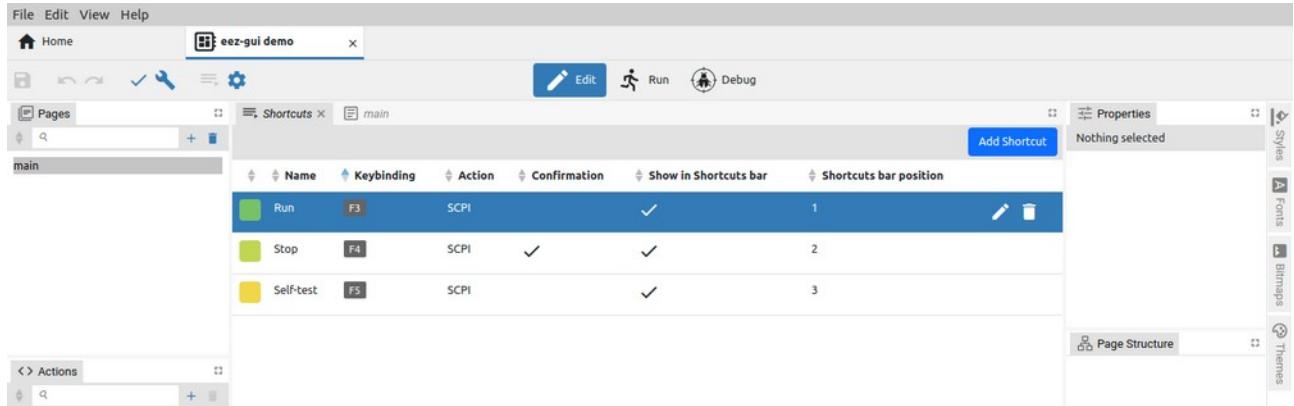

Fig. 41: Font editor page

### P5.1.5. Shortcuts (EEZ-GUI only)

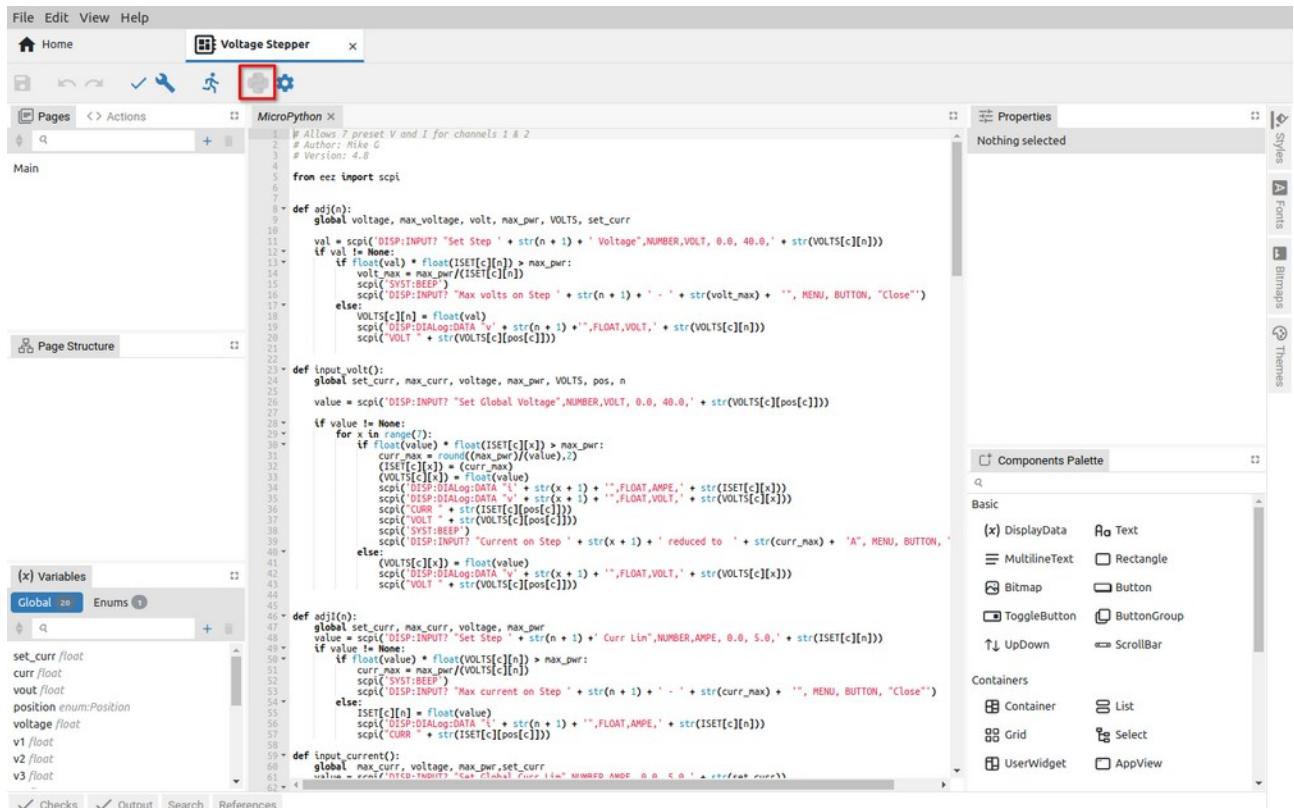

An *EEZ-GUI* project that includes Instrument Extension definitions (*/EXT defs* feature) can also have the *Shortcuts* feature enabled. In this case, the *Shortcuts* icon appears in the toolbar, which is used to display the page for defining shortcuts in the editor tabset (Fig. 42).

*Fig. 42: Project shortcuts page*

## P5.1.6. MicroPython (EEZ BB3 only)

Opens the MicroPython text editor page (Fig. 43).

*Fig. 43: MicroPython editor page*

## P5.1.7. Readme

The project will have a Readme file if the *Readme* feature is selected in the project general settings. It can be used to add clarifications or reminders, e.g. how to build a project for the native platform, information about the target platform, etc.

The readme file defined in *Properties* can be displayed but not edited. The readme file can be removed (1) or its file path can be selected (2). Text (.txt) and markup (.md) file types are supported.

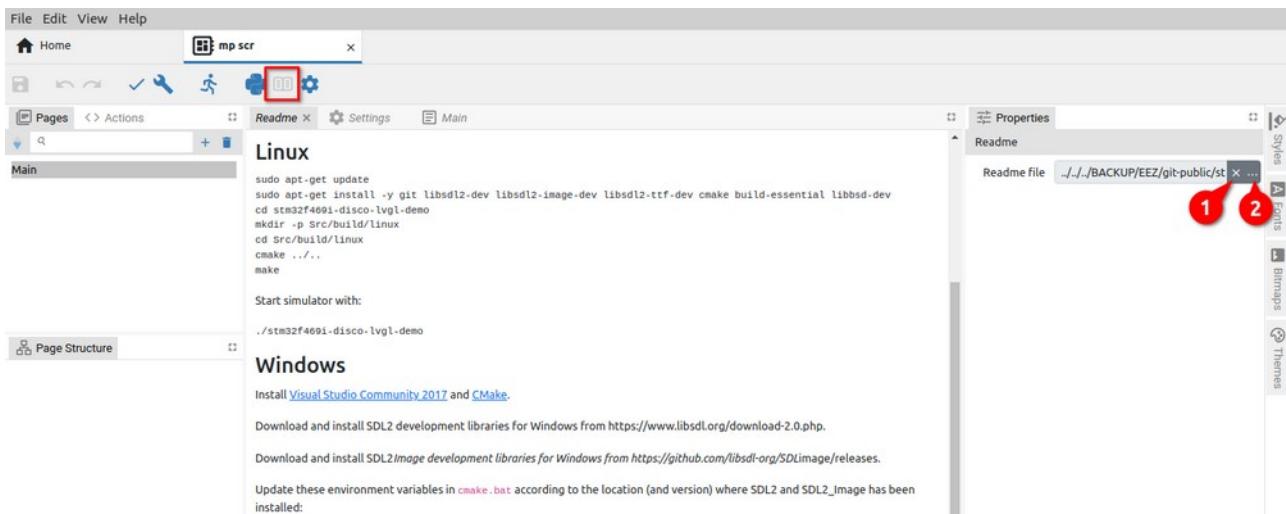

Fig. 44: Project Readme file

### P5.1.8. Settings

The Settings page is used to edit the global parameters and features of the project (Fig. 45).

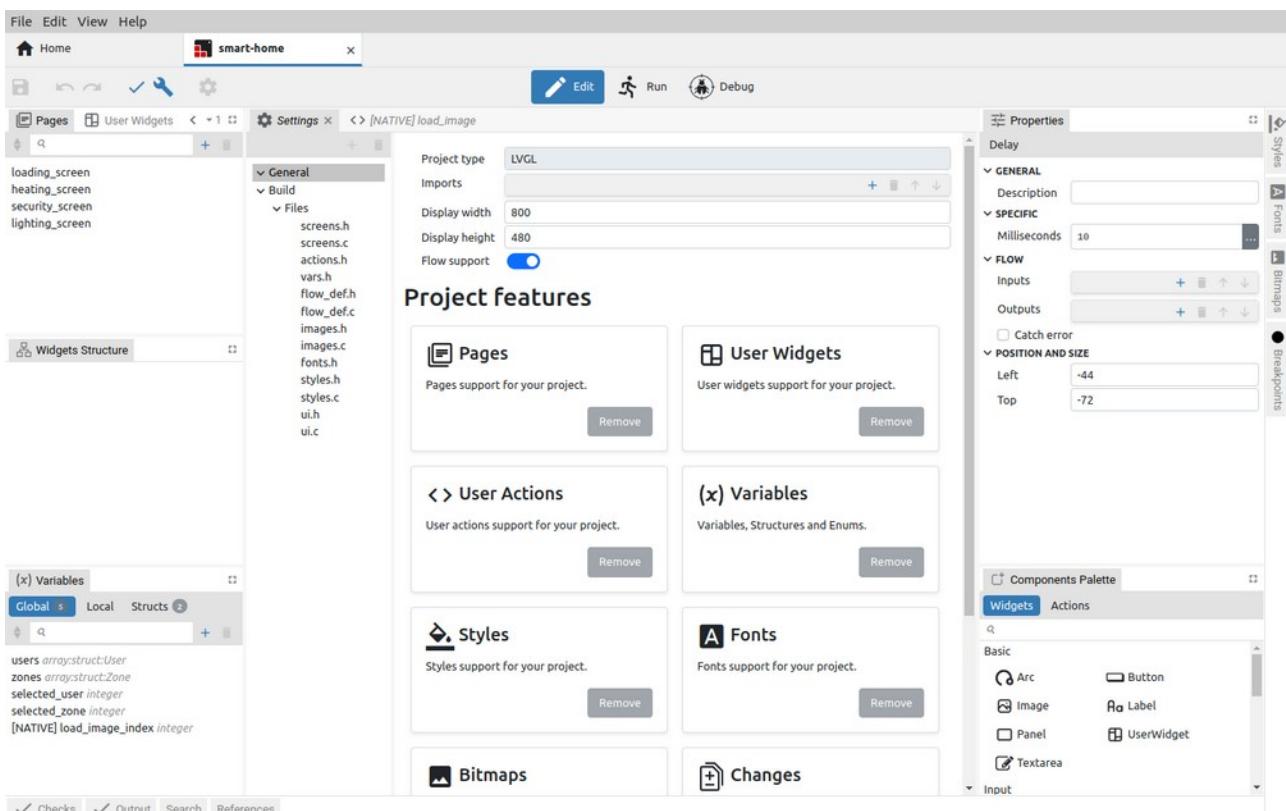

Fig. 45: Project settings page

## P5.2. Viewers

### P5.2.1. Page viewer

In *Run* mode, it is possible to see only the viewer of the currently active page (Fig. 46). In *Debug* mode, pages and Actions cannot be edited, so editors effectively become viewers (Fig. 47).

Fig. 46: Page view in Run mode

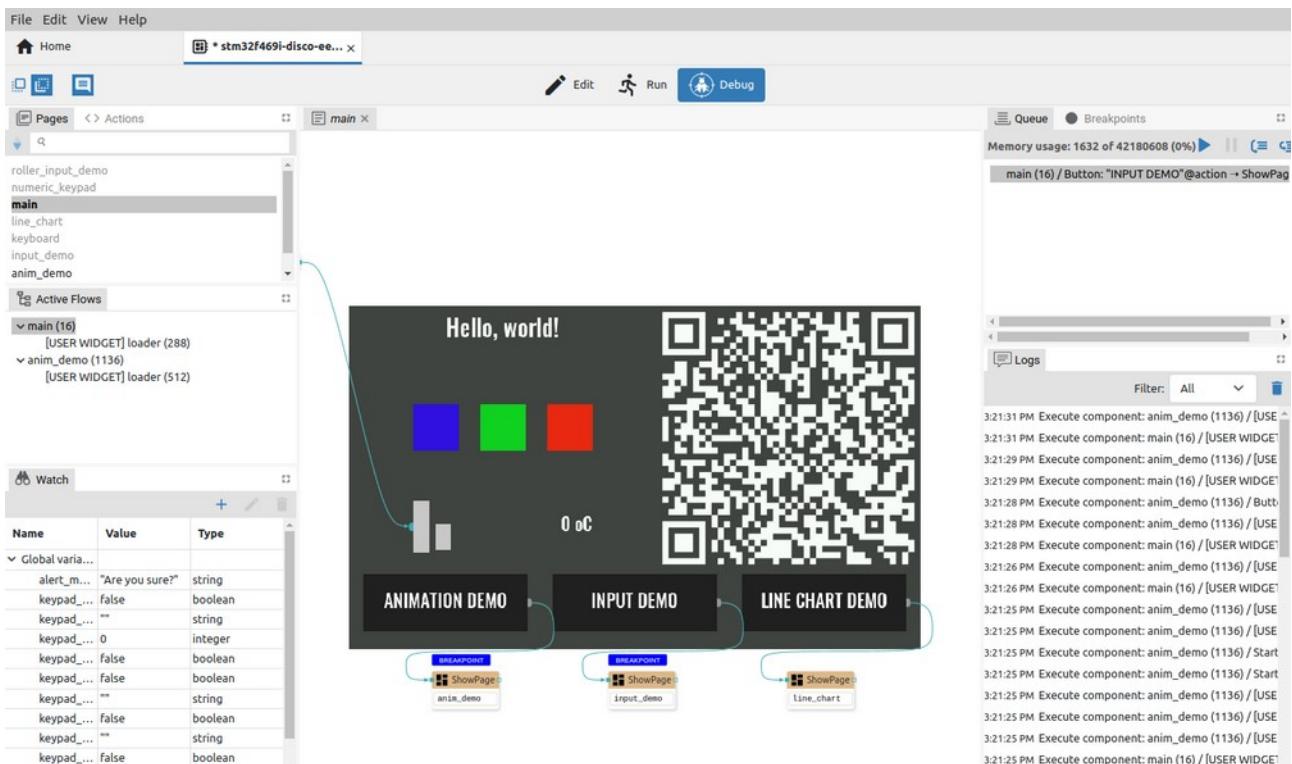

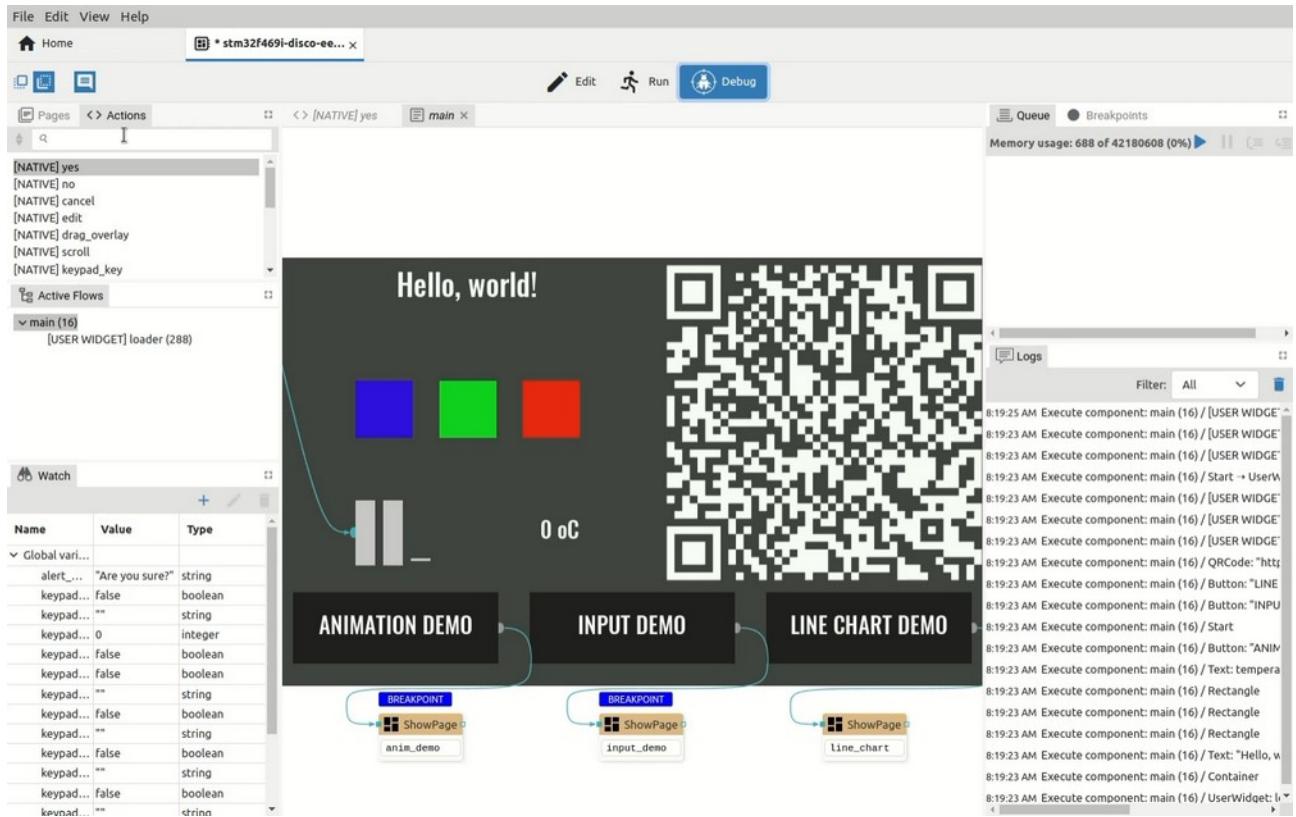

Fig. 47: Page view in Debug mode

## P5.2.2. Action viewer

In the Action viewer, Actions are displayed without the possibility of editing. It is also possible to see which Action components are currently being executed. If the Flow is paused, you can add breakpoints and see what values the component has on the inputs.

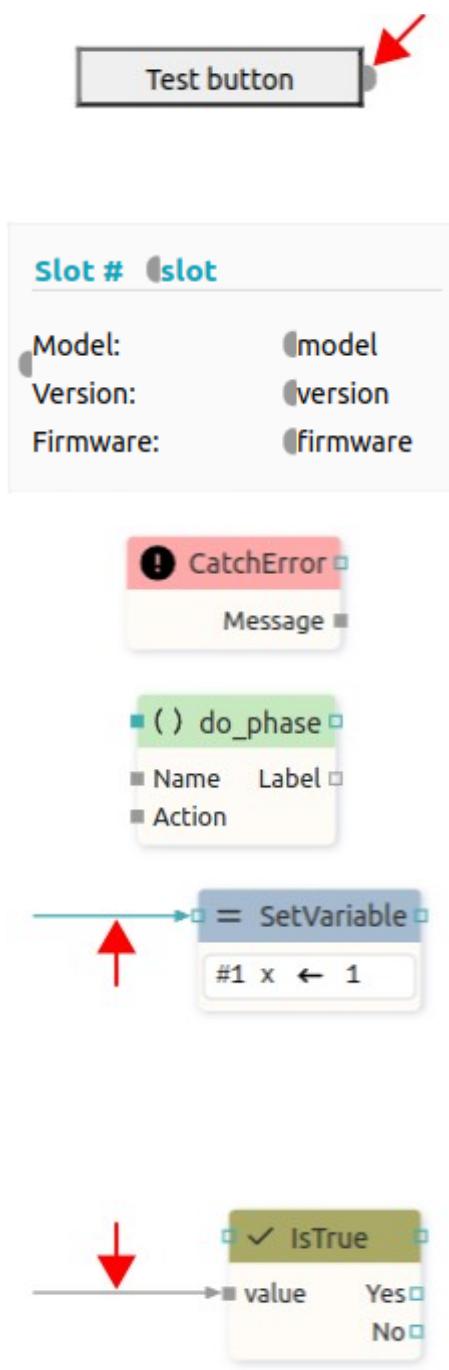

*Fig. 48: Action viewer*

## P6. EEZ Flow

### P6.1. EEZ Flow basic concepts

EEZ Flow is used to add programming logic to a project which enables programming using Flow-charts.

Flow can be an integral part of the page definition because the Widgets can be interactive and thus be an integral part of the Flow (connected to Actions and other Widgets by Flow lines). It is also possible to create a User Action for a Flow that does not have any graphic elements. The basic Flow elements are described below.

#### Widget

A component that adds a visible graphic element to a page. The Widget can be combined with other Widgets and Actions. For this, one or more inputs and outputs can be defined, which are displayed as semicircles on the left or right side (see arrow).

#### User Widget

User Widget is a convenient way to group part of a project that contains graphical elements for further reuse. *Input* and *Output* Actions are used to connect the User Widget with the rest of the Flow which are displayed as semicircles on the left or right side. A User Widget can be created from the *User Widgets* panel (*Add Item* option) or by selecting a part of the flow in the page editor and using the *Create User Widget* option in the right-click menu.

#### Action

A component that has no visible element on the page. An Action usually has at least one input and/or output to connect to other Widgets and Actions.

#### User Action

User Action is a convenient way to group part of a project for further reuse. User Action can use *Start*, *End*, *Input*, *Output* actions as connection points with the rest of the Flow.

#### Sequence Flow line

Sequence Flow line is used to define the execution Flow. The Action or Widget will be executed when it receives execution information on the sequence input (there is no data transfer, so it can be said that "null data" has been received). At the end of the execution of the Action or Widget, information ("null data") is sent to the next one or more Actions or Widgets through the sequence output. Sequence Flow line when not selected is shown in verdigris (greenish-blue) color.

#### Data Flow line

A data Flow line similar to a sequence Flow line can be used to define Flow execution. The data Flow line connects to the data input of the Action or Widget. Likewise, obtaining information after the execution of an Action on the data output is used to pass the execution information to the next one or more Actions or Widgets. In contrast to the sequence Flow line, the actual data is transferred along the data line: integer, string, structure, etc. When the data Flow line is not selected, it is displayed in gray color.

## P6.2. Flow execution

EEZ Studio allows multiple Flows to be executed in parallel within the same project. Project execution monitoring is possible in Debug mode (Fig. 49).

During execution, the current value of all global variables and the list of active Flows is preserved.

At some point there can be one or more active Flows. Each active Flow stores the current values of all its local variables, the values of all inputs on all components and the internal state of all components belonging to that Flow (namely, some components have internal state, for example, the *Loop* component remembers how many times it has looped).

The execution queue contains a list of all components that are ready for execution. All active Flows share the same execution queue.

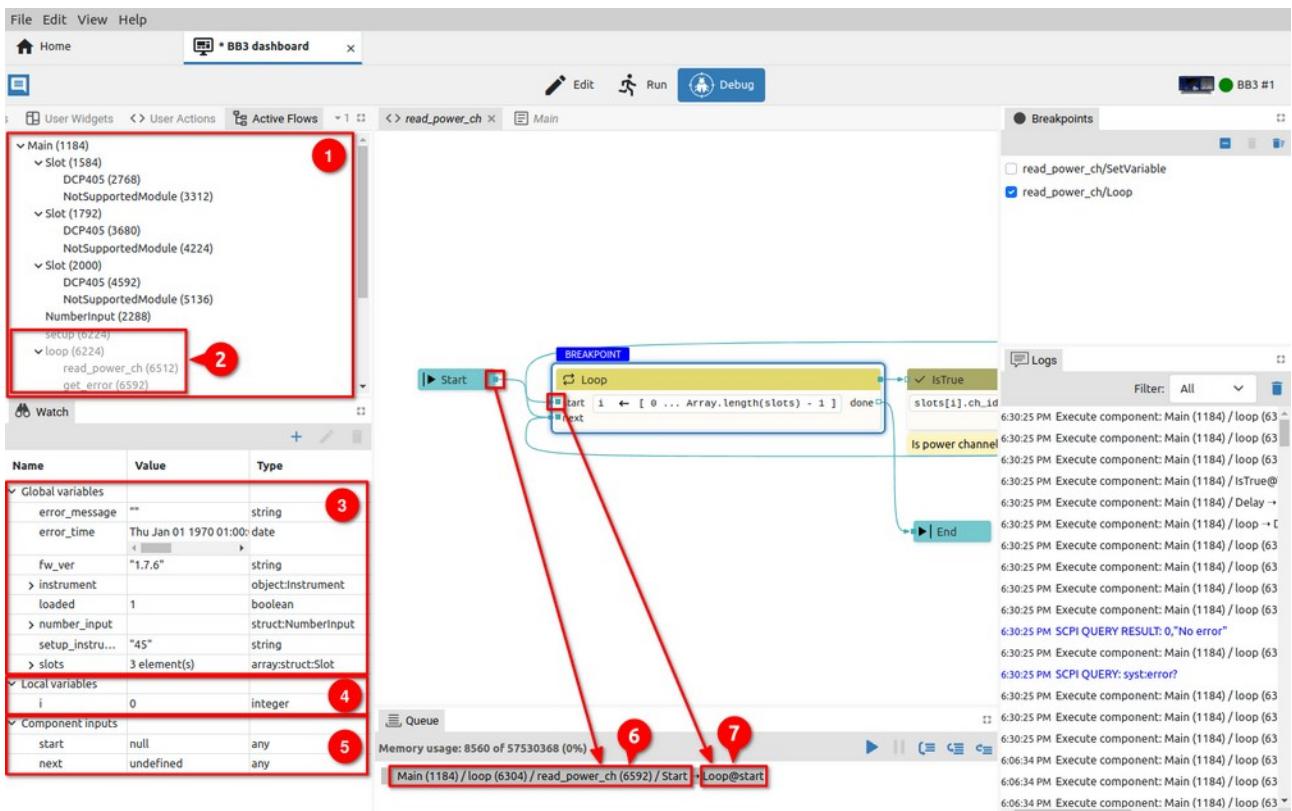

Fig. 49: Flow execution monitoring

When the project is executed in *Debug* mode, we can monitor in the *Active Flows* panel which Flows are active (1) and, as well as those that have finished execution, are no longer active, i.e. they are no longer in the execution queue (2). In the example in Fig. 49 we see that the *Main* page has one active Flow and under it are all the active Flows for the Widgets located in the *Main* page: we have three *Slot* Widgets, and each of them has its own two active Flows under it (*DCP405* and *NotSupportedModule*).

The *Watch* panel allows us to monitor the state of global variables (3). There we also find a list of local variables of the currently active Flow (4) as well as the input state of the component that will be executed next (5).

Numbers in parentheses next to the Flow name are memory addresses where the state of an individual active Flow is stored (e.g. 1184 for *Main* Flow).

One component at a time is taken from the beginning of the execution queue and executed.

During the execution of a component, data can be sent to one of the outputs, which will then be forwarded via Flow lines to the inputs of other components.

In the *Queue* panel, we can see the current activity, for example, that a value was sent from the output of the *Start* component to the *Start* input of the *Loop* component.

At the moment when the component receives data via the Flow line on one of the inputs, it will be placed at the end of the execution queue (i.e. it is ready for execution when it comes to its turn) if by then it has received data on all data inputs and on at least one sequence input (if such exists). If there is no Flow line that ends in an input, then that input is not looked at in this test.

Why only one sequence input? For example, the *Loop* component has two sequence inputs, *Start* and *Next*, and it is enough for one of them to receive data to become ready for execution (once on *Start* and later multiple times on *Next*).

When executing the component, all sequence inputs are deleted (data value is cleared), and data inputs keep the current data (last data value is kept). Which means that if new data comes later on only one sequence input, the component will be executed again because it already has data on all data inputs since they have been saved. Exceptions are possible here when a component can delete the value on one of its data inputs by itself. For such components, it will be specifically stated in its description.

If the component has no inputs (or if there is no Flow line that ends in one of the component's inputs), then it is immediately placed in the execution queue during initialization (i.e. when the Flow is started). For example *Start* is such a component and it is always executed immediately.

The *Catch* error component, although it has no inputs, will not be executed immediately, but only when an error occurs in the Flow in which it is located.

The *OnEvent* component also has no inputs and will not be executed immediately, but only when a page event occurs (examples of page events: open page, close page).

Widgets are executed immediately. Namely, Widgets are also components that participate in the execution of the Flow: they can receive values on their inputs and can send values through their outputs.

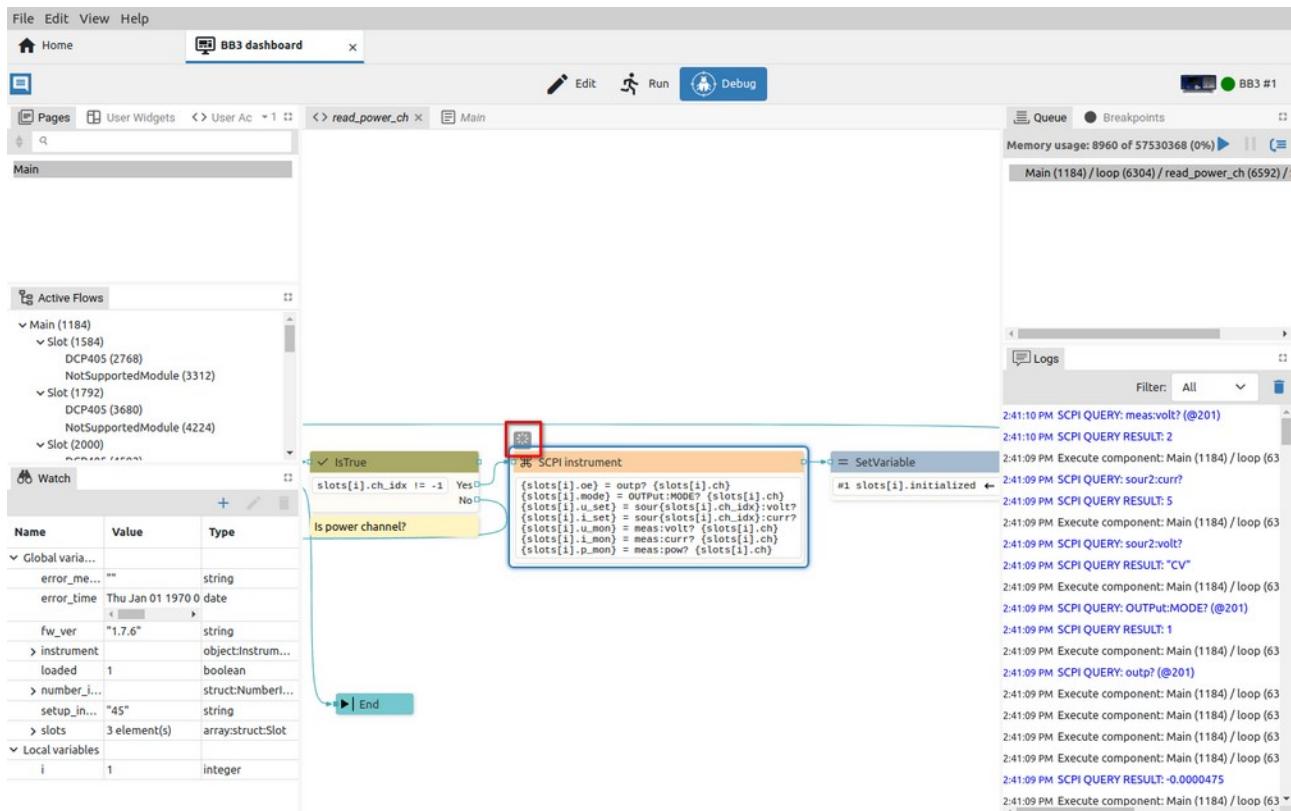

Fig. 50: Indication that the component preserves internal states

Components that preserve internal state, i.e. whose execution takes a long time, are also marked with a special icon in the debugger (Fig. 50). Example of such components: Loop, Delay, SCPI, etc. Such components, when they have done part of their work, can put themselves back in the queue. For

example The SCPI component executes the first command, is placed in the queue again, then executes the second command, is placed in the queue, and so on until the last command - while keeping the information in its internal state about which command it reached. In this way, parallel execution of all Flows was achieved, i.e. there is no waiting for the SCPI component to execute all its commands before some other component can be executed.

### P6.3. Flow examples

Flow execution will depend on the way components are connected. In Fig. 51 shows four simple Flows that contain User Actions whose inputs are triggered in different ways. Fig. 52 also shows the final execution results when the defined string will appear upon startup (4), with a defined delay (1) (3) or will not be displayed at all due to incorrect connection (2).

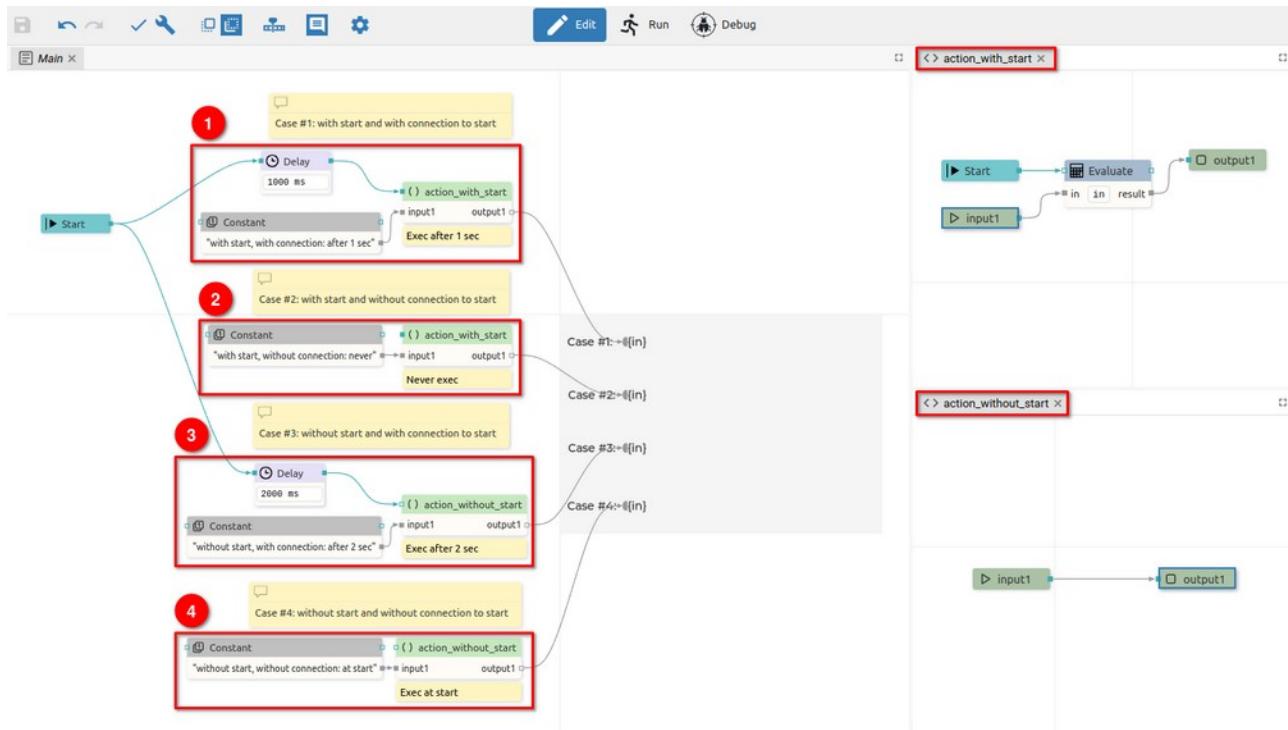

Fig. 51: Flow execution examples

Case #1 contains the User Action *action\_with\_start* that implements the *Start* action, making the sequence flow input mandatory. Flow will display the result after the 1 second *Delay* action is over. Case #3 will behave in the same way, where even though the sequence flow input is not mandatory (*action\_without\_start* is used).

In Case #4, it can be seen that if the sequence flow input is not mandatory, the User Action will be executed immediately at the start when the *Constant* will pass the string to be displayed.

In Case #2, we have a mandatory sequence input and nothing is connected to it. The Action will therefore not be executed and an error will be displayed in the editor.

*Important: Although case #2 reports an error in the editor, it is allowed to run such a Flow. This is handy in case when not everything is connected, but we still want to test what has been done so far.*

Fig. 52: Execution results

## P7. Project editing

Designing the graphical layout of the page is possible by simple drag & drop of one or more Widgets from the *Components palette*. The first step is to click on the Widget and hold which will change the cursor (Fig. 53)

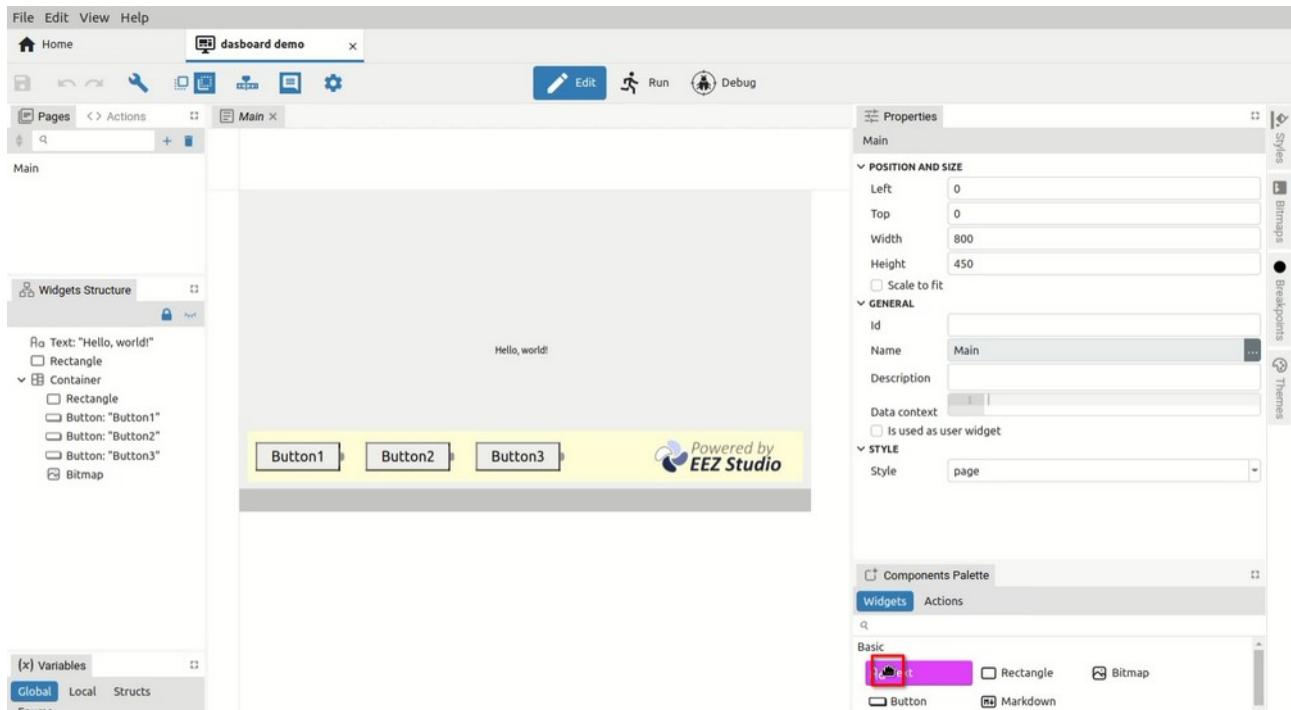

Fig. 53: Selection of Widget to add to the page

When the Widget is dragged into the editor area, auxiliary snap lines will appear immediately, which will make it easier to place the Widget in the desired place. Snap lines are displayed depending on nearby objects. If the position of the new Widget is not close enough to the others, or if it is the first Widget added to the page, the snap will be possible towards the page itself as in the examples in Fig. 54 where snap lines appear for horizontal or vertical centering.

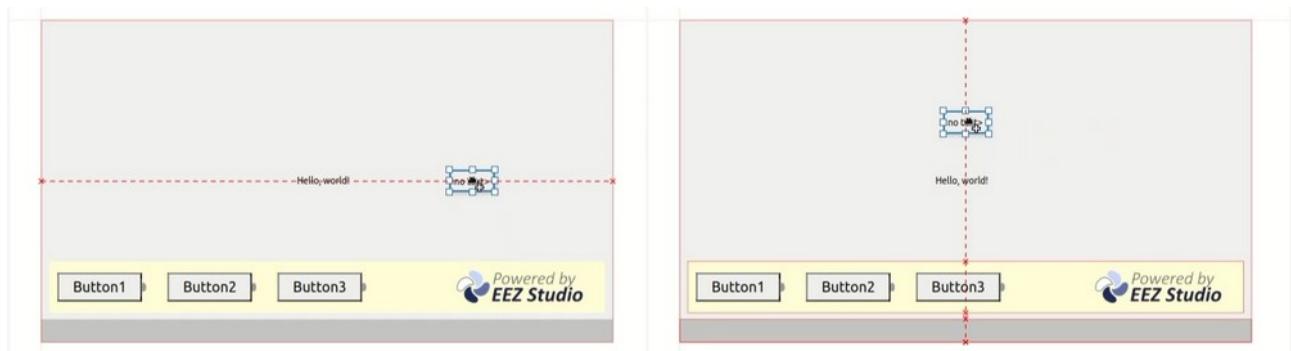

Fig. 54: Snap lines for centering in the page

Fig. 55: Snap lines for positioning versus other Widgets

Fig. 55 shows examples of snap lines to the edges of other Widgets on the page.

*In the event that snap lines become a nuisance during positioning for any reason, they can be disabled by holding down the SHIFT key while moving.*

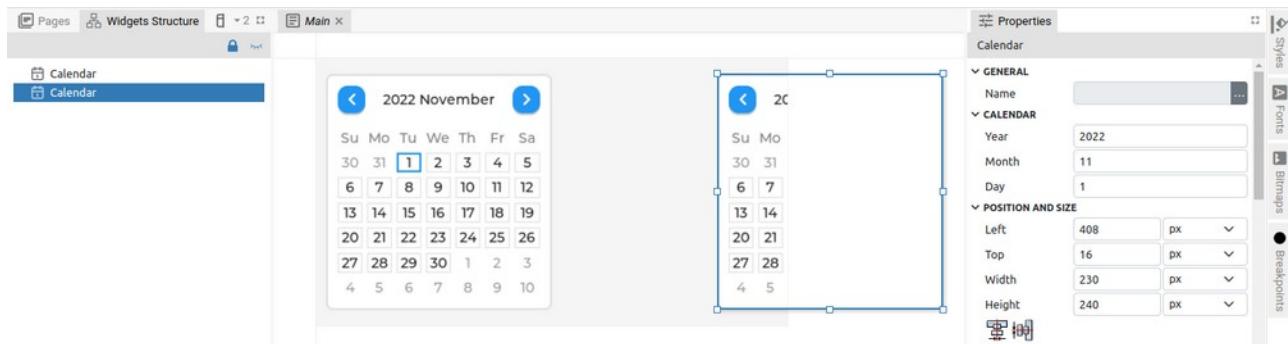

Fig. 56: Widget positioned outside the page

Please note that if the Widget in the *EEZ-GUI* and *LVGL* projects is set to protrude from the page (Fig. 56), the part that is outside the page will not be visible.

Widget positions can be freely changed and this can be done for one or more selected Widgets. It is possible to select multiple Widgets (Fig. 57): both in the page editor (1) or in the *Page Structure* panel (2). In both cases, information will appear in the *Properties* panel that multiple Widgets are selected (3). When selecting in the *Page Structure* panel, it is possible to use the SHIFT key to select a continuous sequence or CTRL to add individual Widgets to the selection.

There are two methods of multiple selection in the editor: selecting Widget by Widget while holding down the SHIFT key, and the second method is the so-called rubber band selection shown in Fig. 58 when selecting the area that will include the Widgets we want to select.

Fig. 57: Multiple Widgets selection

First you need to click on a place outside the Widget, then drag the mouse and release the button (a rectangle is displayed and when the mouse is released all Widgets inside will become selected).

Fig. 58: "Rubber band" selection

As shown in Fig. 57, it is possible to change *Properties* for multiple Widgets. Specific to multiple selection is the *Position and size* section when the *Align* subsection gets more options, and a complete *Distribute* subsection appears.

The *Distribute* subsection will be enabled only if three or more Widgets are selected.

### Align

Icon	Title	Description
	<i>Align left edges</i>	Align to the left edge of the leftmost Widget.
	<i>Center on vertical axis</i>	Vertical centering towards the center of the widest Widget.
	<i>Align right edges</i>	Align to the right edge of the rightmost Widget.
	<i>Align top edges</i>	Align to the top edge of the uppermost Widget.
	<i>Center on horizontal axis</i>	Horizontal centering towards the center of the tallest Widget.
	<i>Align bottom edges</i>	Align to the bottom edge of the lowest positioned Widget.

### Distribute

Icon	Title	Description
	<i>Distribute left edges equidistantly</i>	Distribution of all Widgets between leftmost and rightmost Widgets for equal distance between left edges.
	<i>Distribute centers equidistantly horizontally</i>	Distribution of all Widgets between leftmost and rightmost Widgets for equal distance between centers.
	<i>Distribute right edges equidistantly</i>	Distribution of all Widgets between leftmost and rightmost Widgets for equal distance between right edges.
	<i>Make horizontal gaps equal</i>	Distribution of all Widgets between leftmost and rightmost Widgets for an equal gap between them.
	<i>Distribute top edges equidistantly</i>	Distribution of all Widgets between the uppermost and the lowest positioned Widget for equal distance between top edges.
	<i>Distribute centers equidistantly vertically</i>	Distribution of all Widgets between the uppermost and the lowest positioned Widget for equal distance between centers.
	<i>Distribute bottom edges equidistantly</i>	Distribution of all Widgets between the uppermost and the lowest positioned Widget for equal distance between bottom edges.
	<i>Make vertical gaps equal</i>	Distribution of all Widgets between the uppermost and the lowest positioned Widget for an equal gap between them.

The page in the editor can be resized or set to the default size (1:1) or scrolled horizontally and vertically within the editor. For these operations, the mouse wheel is used in combination with the SHIFT and CTRL keys, as shown in Fig. 59.

Operation	Description
Page view resize	CTRL + mouse wheel is used to zoom the page.
Horizontal scroll	SHIFT + mouse wheel is used for horizontal page scrolling.
Vertical scroll	The mouse wheel is used for vertical page scrolling.
Move page	The page can be moved with the middle or right mouse button.
View reset	Double-click resets the zoom and centers the page.
Move Widget	Drag and drop is used to move selected Widgets within the page.

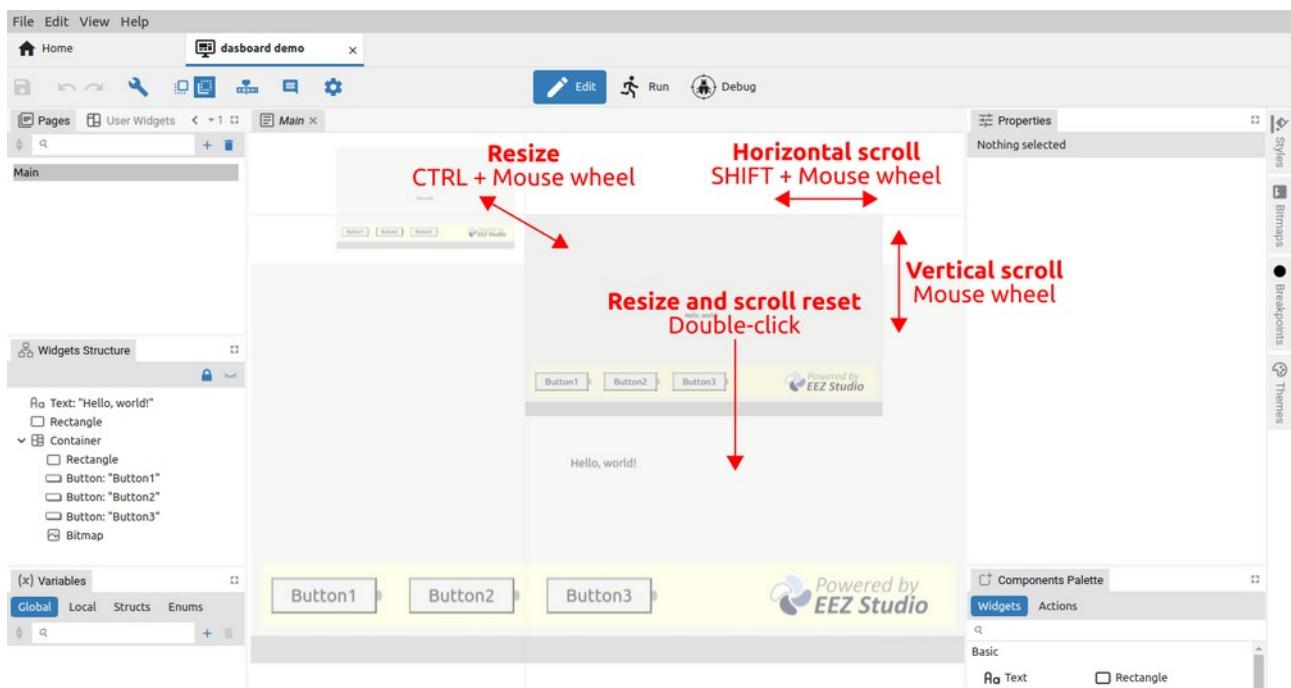

Fig. 59: Page resize and scroll

### P7.1.1. Connecting Flow components

The connection (Flow line) between Flow components (Widgets and Actions) is used to define the flow of execution. In Fig. 54 shows how the output of one Action is connected to the input of another Action. When we position ourselves on the output (1), the color of its background will change, and if we continue with the mouse drag, the Flow line (2) will appear. When the cursor reaches the input of the second component, the Flow line will change color to green (3). Now we can release the mouse when the connection between the two components will be established (4). In case of moving one of the components, the Flow line will move with it.

To delete the Flow line, it will be necessary to select the Flow line (the color will change to red) and select the Delete option in the right-click menu (or the DEL key).

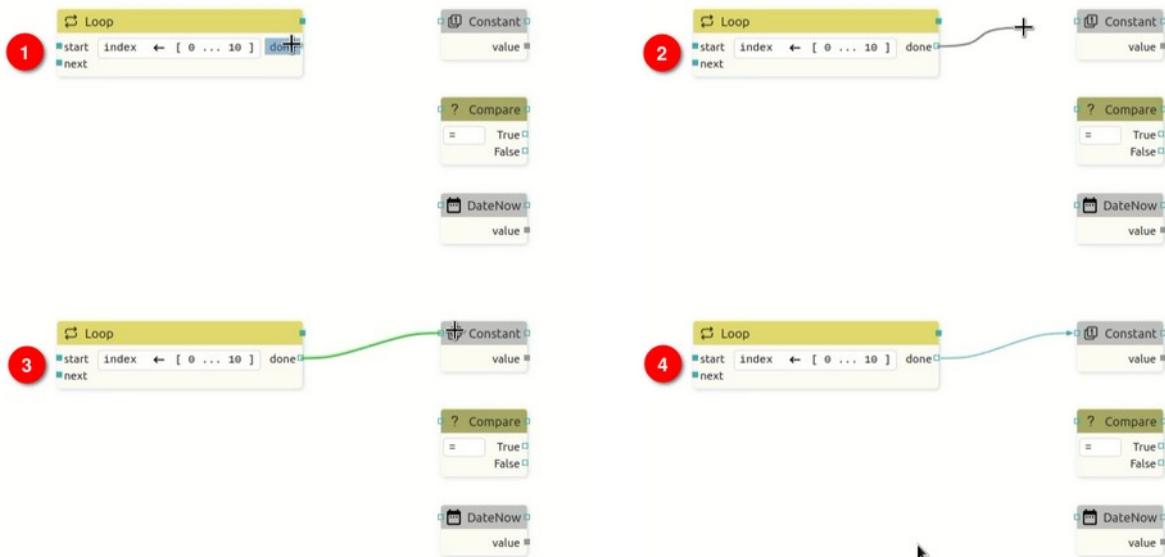

Fig. 60: Connecting the output to the input of the Widget

Adding a Flow line is also possible by starting from the input of one component to the output of another. In Fig. 61 shows how to connect the input of one Action to the output of another.

Note that it is possible to connect more than one Flow line to the single output, which also applies to the connection to the single input.

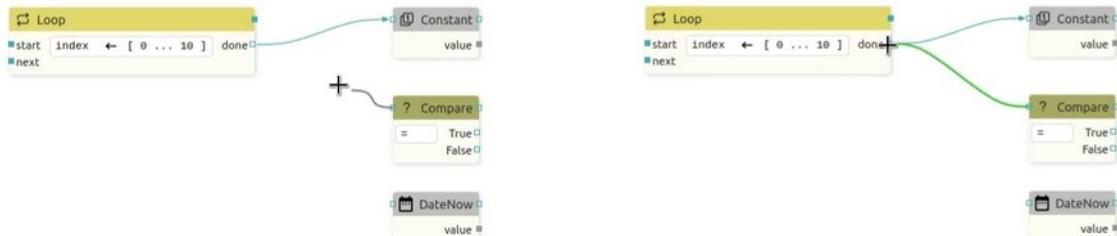

Fig. 61: Connecting the input to the output of the Widget

In case we have multiple Flow lines that end at a single input or output, it is possible to move them all to another input or output if necessary. Example in Fig. 62 shows the multiple Flow line moving from one output to another. First, we need to get to the output when the color of the background and all affected flow lines (1) will change. Then we need to drag the mouse while holding SHIFT, and a copy of the selected lines will appear, and their end can now be moved as desired (2). When we reach a new output, the color of the flow lines changes to green (3) and when the mouse button is released, a new connections will be drawn.

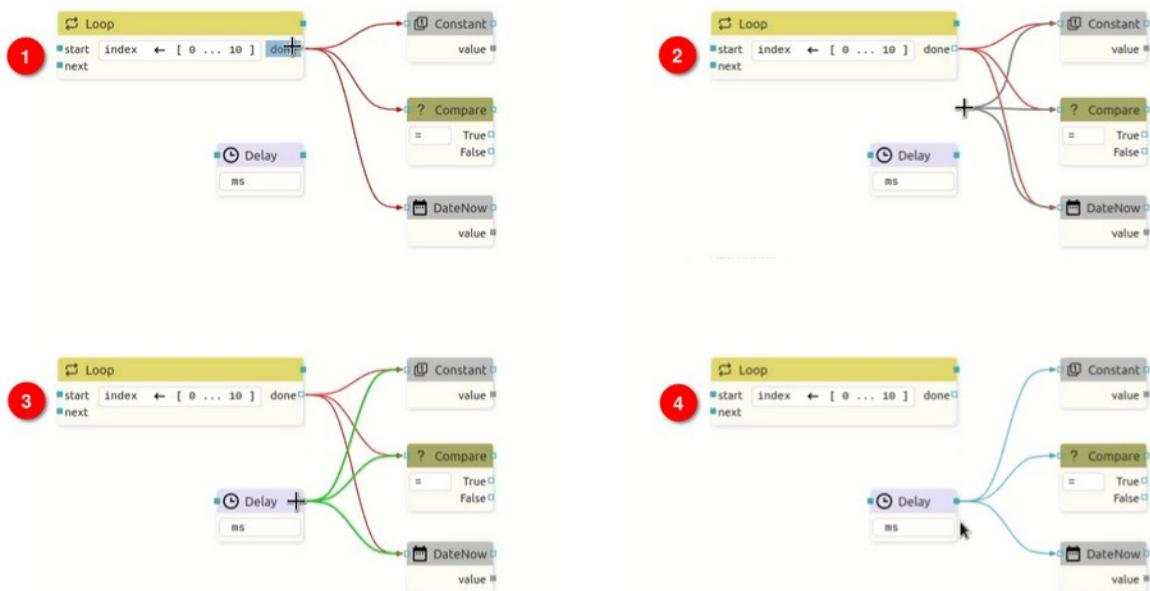

Fig. 62: Moving multiple connections

### P7.1.2. Copy & Paste between two projects

To copy between two projects, it will be necessary to open two EEZ Studio windows using the *New window* (CTRL + SHIFT + N) option from the *File* menu. In the first project, select the section you want to copy and select the *Copy* option from the right-click menu (or CTRL + C) to copy to the clipboard. From the clipboard, the selected section can now be inserted into another project using the right-click menu *Paste* option (or CTRL + V).

## P7.2. Working with Widgets

Widget components allow us to quickly add graphics to the page because each one implements a specific element (e.g. button, text, bitmap, QR code, etc.) that can be easily customized as needed. Widgets are located in the *Widgets* subtab of the *Components Palette*, where they are grouped for easier finding.

EEZ Studio supports two types of Widgets that cannot be mixed with each other:

- *EEZ-GUI (Native)* – Widgets created for the purposes of creating the EEZ BB3 embedded GUI for the STM32 family of MCUs that support graphics (Fig. 63)
- *LVGL* – Widgets from the open-source embedded graphics library LVGL. They can only be used in a project of type LVGL. (Fig. 64)

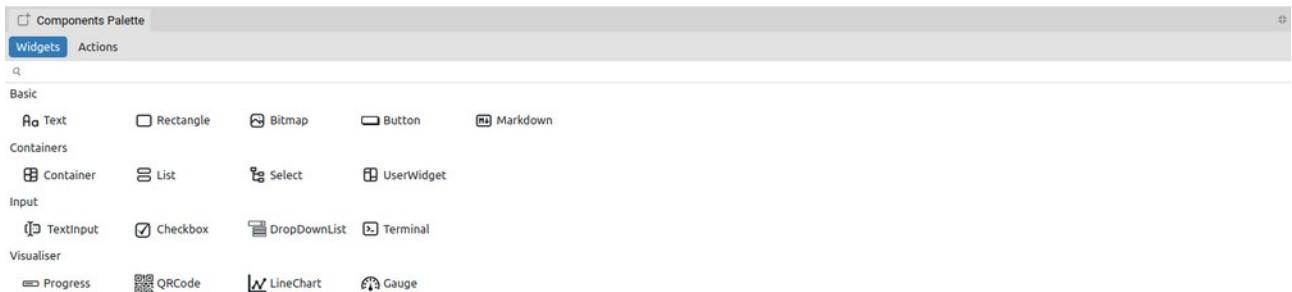

Fig. 63: Widgets palette for the EEZ-GUI project

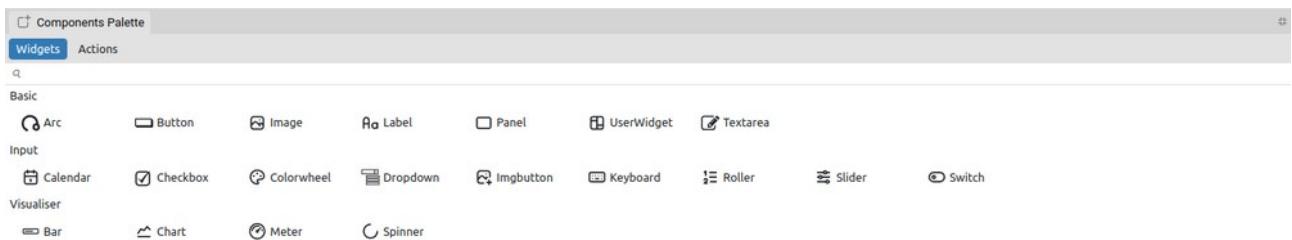

Fig. 64: Widgets palette for the LVGL project

### P7.2.1. Widget component's items

Widget component items are shown in Fig. 65 and described below.

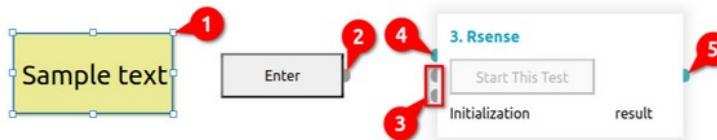

Fig. 65: Widget components items

#	Item	Description
1	<i>Selection handlers</i>	They appear when the Widget is selected and allow it to be resized in all directions.
2	<i>Sequence Output</i>	The mandatory sequence output must be connected, otherwise it will generate an error as the Widget will not be able to perform correctly.
3	<i>Sequence Input</i>	The mandatory sequence input must be connected, otherwise it will generate an error since the Widget will not be able to perform correctly.
4	<i>Data Input</i>	The mandatory data input must be connected, otherwise it will generate an error as the Widget will not be able to perform correctly.

## 5 Data Output

The mandatory data output must be connected, otherwise it will generate an error as the Widget will not be able to perform correctly.

Table 2 shows all types of I/O pins used as Flow line connection points for both Widgets and User Widgets.

Pin	Description
	Sequence input pin (Flow line connection point).
	Sequence output pin.
	Data input pin.
	Data output pin.

Table 2: User Widget's pin types

### P7.2.2. Creating a User Widget

The use of User Widgets contributes to modularity, which simplifies maintenance if the same layout elements appear in multiple places on the same or multiple pages. Each change will not need to be implemented in several places, but only in the User Widget.

A project can have an arbitrary number of User Widgets. User Widgets are displayed in the User Widgets panel, where new ones can be added and existing ones can be deleted.

A new User Widget can be created in two ways: using the *User Widgets* panel or the Right-click menu.

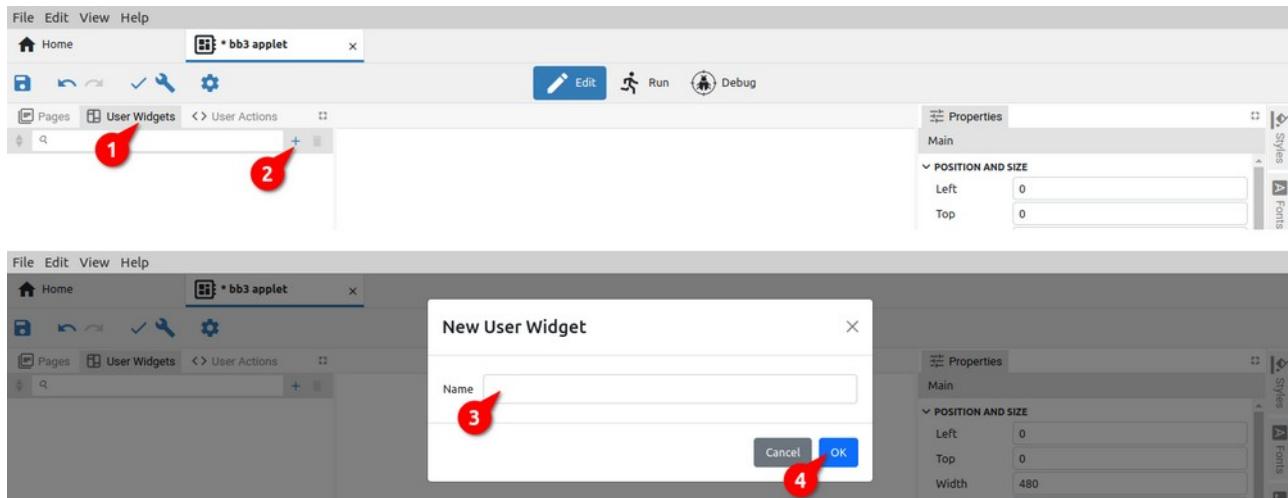

Fig. 66: Creating a new User Widget from the User Widgets panel

In the first case, select the *User Widgets* panel (1) and then the *Add* option (2), when a dialog box for entering the name of the User Widget will appear (Fig. 66).

After confirmation (4), the newly added User Widget will appear in the *User Widgets* list, where when selected, the editor opens where you can continue editing by adding Widgets and Actions. A User Widget can also contain multiple User Widgets and User Actions.

User Widget added in this way will by default contain a page with dimensions defined in the general Settings of the project. In the example in Fig. that's 480 x 272 pixels. It will also inherit the default style (hence the background is dark blue). The page will be positioned at the starting point (x = 0, y = 0).

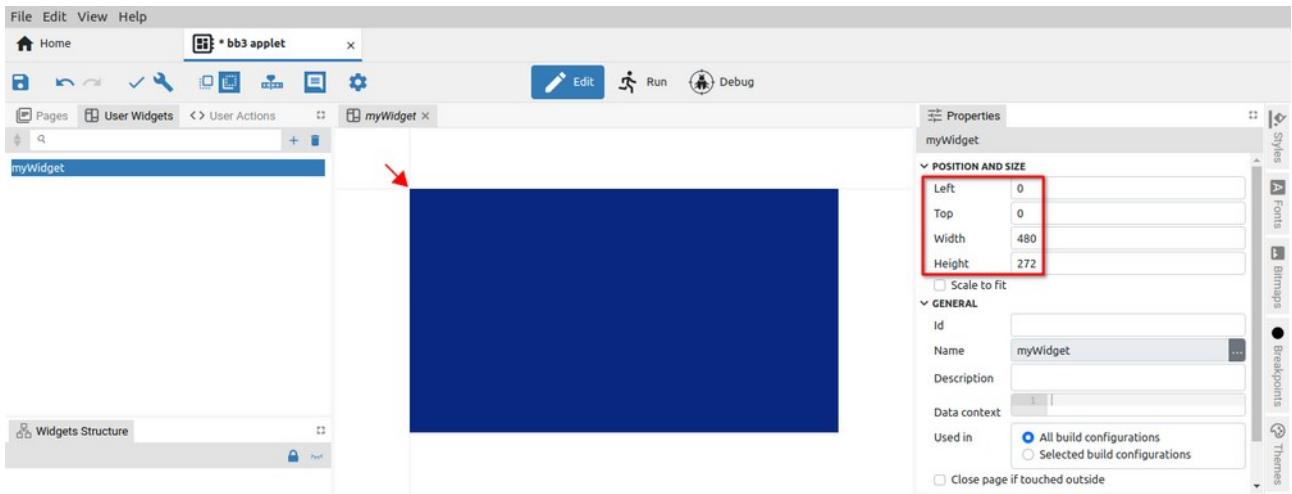

Fig. 67: Page editor of the newly created User Widget

User Widget can also be created by selecting one or more components on the currently displayed page (1) as shown on Fig. 68. By selecting the right-click menu option *Create User Widget*, a dialog box will appear as in the previous case (Fig. 66).

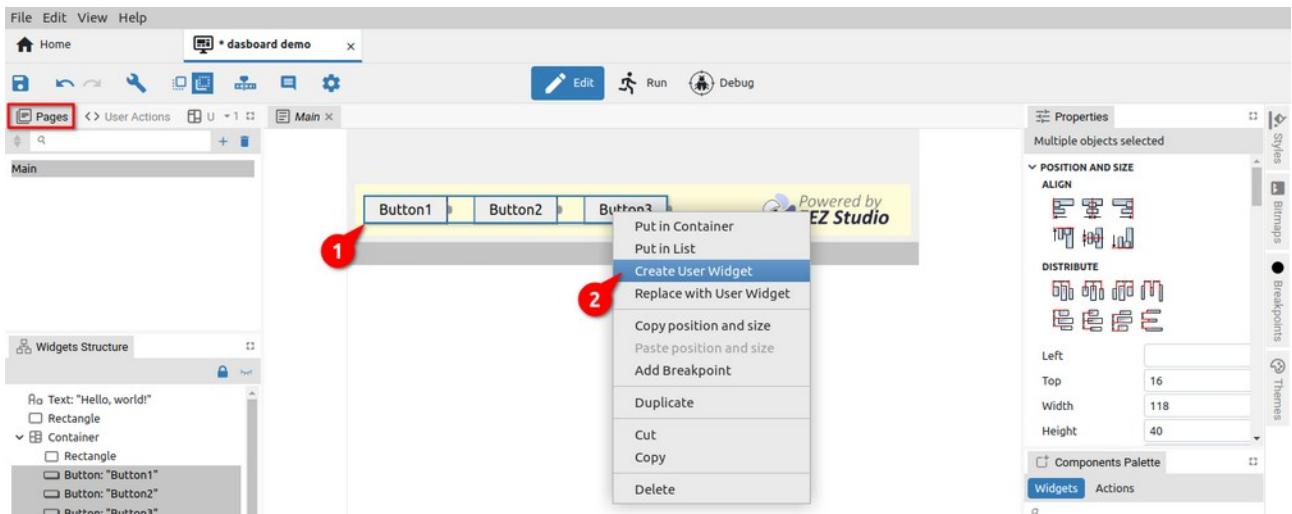

Fig. 68: Creating a new User Widget using the right-menu option

After successfully adding a new User Widget, it can be edited in the page editor (Fig. 69). Unlike the previous case, this Widget will have the dimensions of the original selection and the first component will be positioned at the starting point.

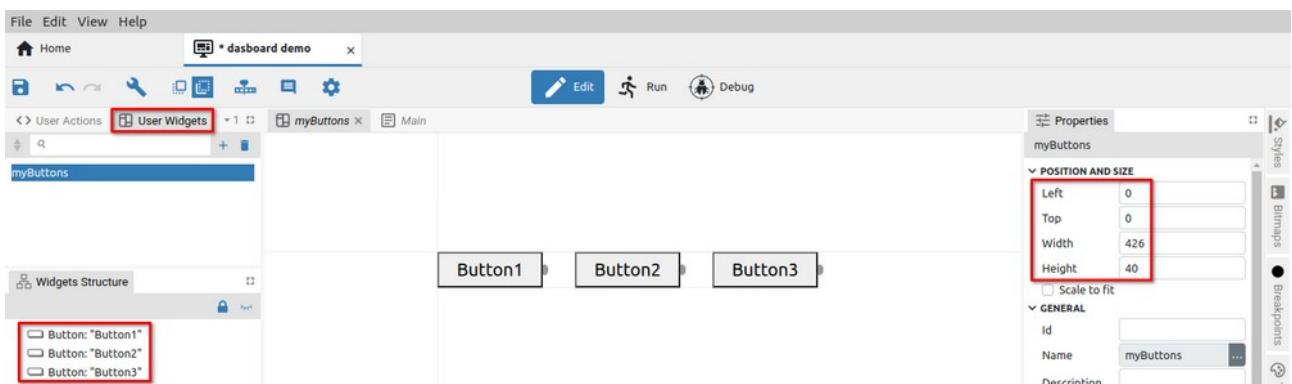

Fig. 69: The newly created User Widget in the editor

### P7.3. Working with Actions

Action unlike Widget does not have a graphical representation. It only performs some function/operation when executed.

The Actions that come with EEZ Studio (i.e. built-in Actions) are located in the *Actions* subtab of *Components Palette* and are added to the editor with drag & drop and grouped for easy finding. The number of implemented Actions depends on the type of project. In Fig. 70 shows the Actions for the Dashboard project, and Fig. 71 for the LVGL project.

The Action can also be implemented in the EEZ Studio extension. An example of such an Action is *Postgres*, which is shown in the *eez-Flow-ext-postgres* group (Fig. 70).

EEZ Studio also allows defining User Actions. To edit them, we use the User Actions editor. All User Actions are also listed at the bottom of the Actions subtab (Fig. 71), from where they can be added to the project with drag and drop as any Action or Widget (1).

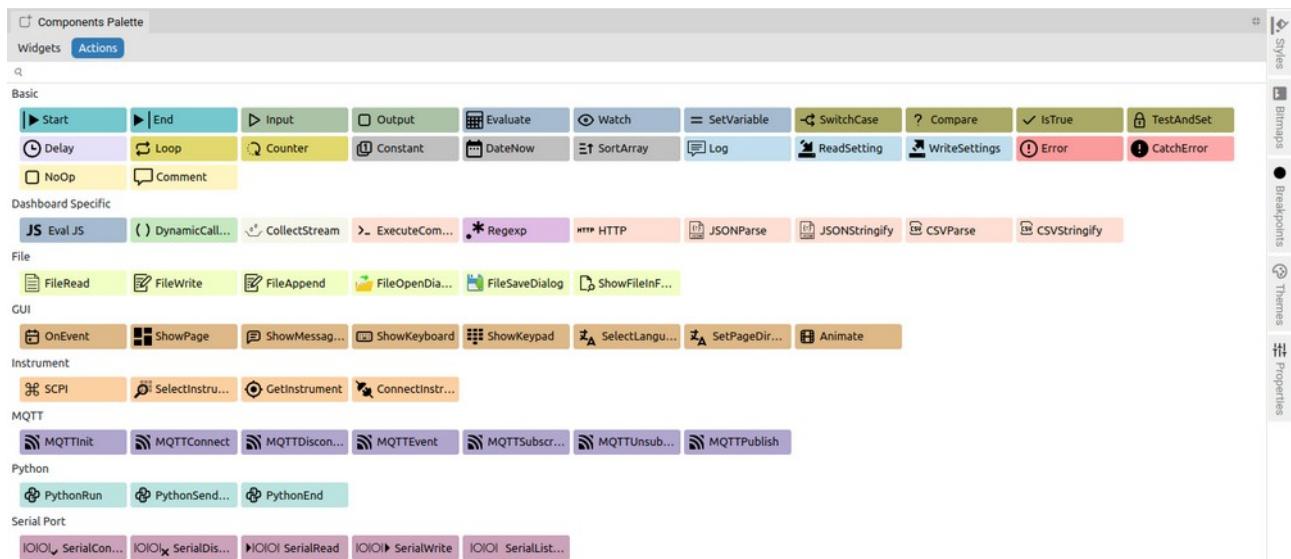

Fig. 70: Actions palette for the Dashboard project

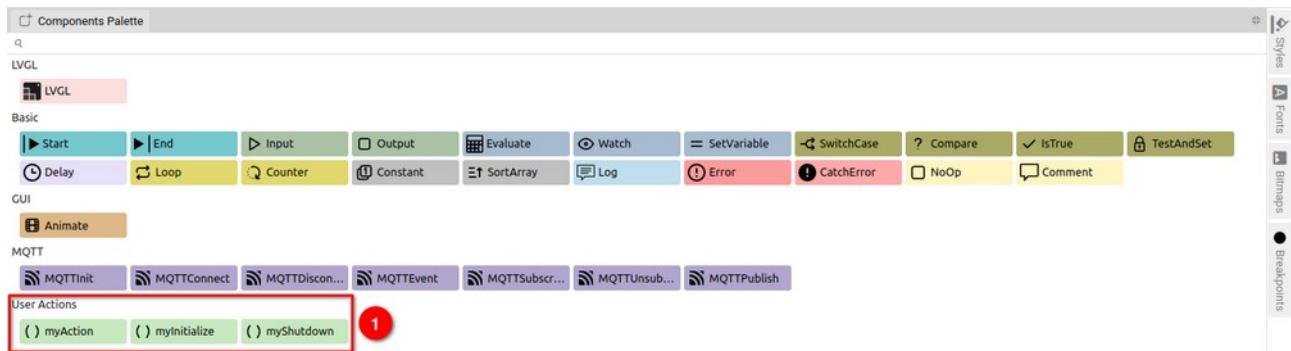

Fig. 71: Actions palette for the LVGL project

### P7.3.1. Action component's items

Action component items are shown in Fig. 72 and described below.

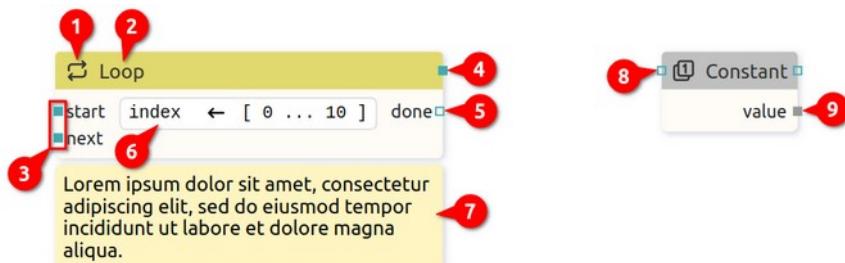

Fig. 72: Action components items

#	Item	Description
1	<i>Icon</i>	Component icon (cannot be changed).
2	<i>Name</i>	Component name (cannot be changed).
3	<i>Mandatory sequence inputs</i>	The mandatory sequence input must be connected, otherwise it will generate an error since the component will not be able to perform correctly.
4	<i>Mandatory sequence output</i>	The mandatory sequence input must be connected, otherwise it will generate an error as the Action will not be able to perform correctly.
5	<i>Optional sequence output</i>	Sequence output that does not necessarily need to be connected for the Action to execute regularly.
6	<i>Additional information</i>	Optional display of additional Action component information.
7	<i>Description</i>	Component description as defined in Properties.
8	<i>Optional sequence input</i>	Sequence input that does not necessarily need to be connected for the Action to execute regularly.
9	<i>Mandatory data output</i>	The mandatory data input must be connected, otherwise it will generate an error as the Action will not be able to perform correctly.

Table 3 shows all types of I/O pins used as Flow line connection points for both Actions and User Actions.

Pin	Description
<span style="background-color: #00AEEF; width: 15px; height: 15px; display: inline-block;"></span>	Mandatory sequence input or output pin (Flow line connection point).
<span style="border: 1px solid #00AEEF; width: 15px; height: 15px; display: inline-block;"></span>	Optional sequence input or output pin.
<span style="background-color: #808080; width: 15px; height: 15px; display: inline-block;"></span>	Mandatory data input or output pin.
<span style="border: 1px solid #808080; width: 15px; height: 15px; display: inline-block;"></span>	Optional data input or output pin.

Table 3: Action's pin types

### P7.3.2. Creating a User Action

Using User Actions contributes to Flow's readability and modularity, which makes it easier to maintain if the same functionality appears in multiple places. Thus, each change will not need to be implemented in multiple places, but only in the User Action.

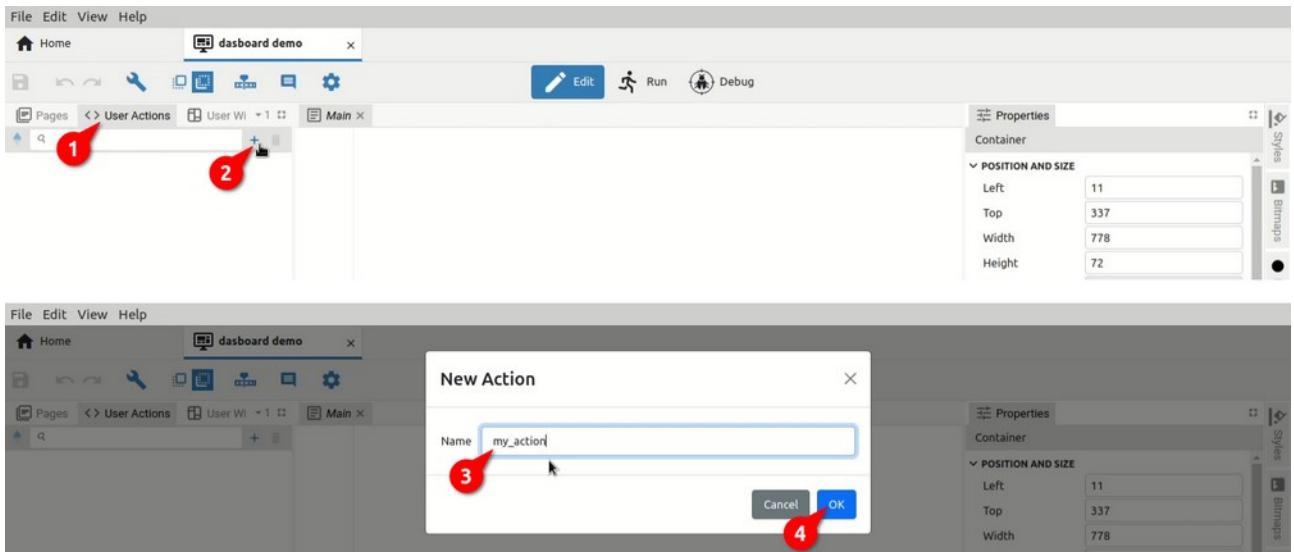

Fig. 73: Creating a new User Action

Please note that adding a User Action to itself is also allowed. However, care should be taken that it is connected in such a way that it does not create an infinite loop during execution.

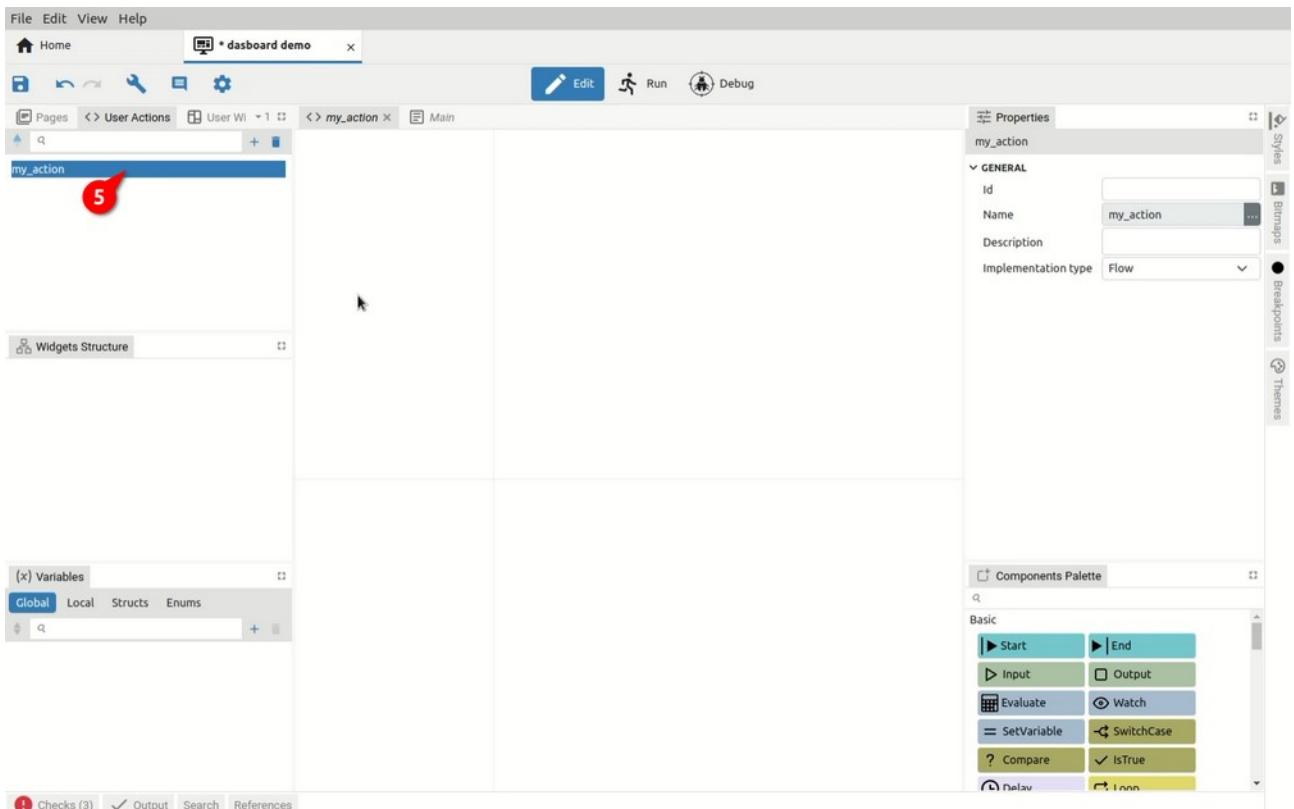

Fig. 74: Flow editor of the newly created User Action

Fig. 75 shows several examples of User Actions and how the use of sequence and data flow lines affects the appearance of the components that will be displayed in the Action palette.

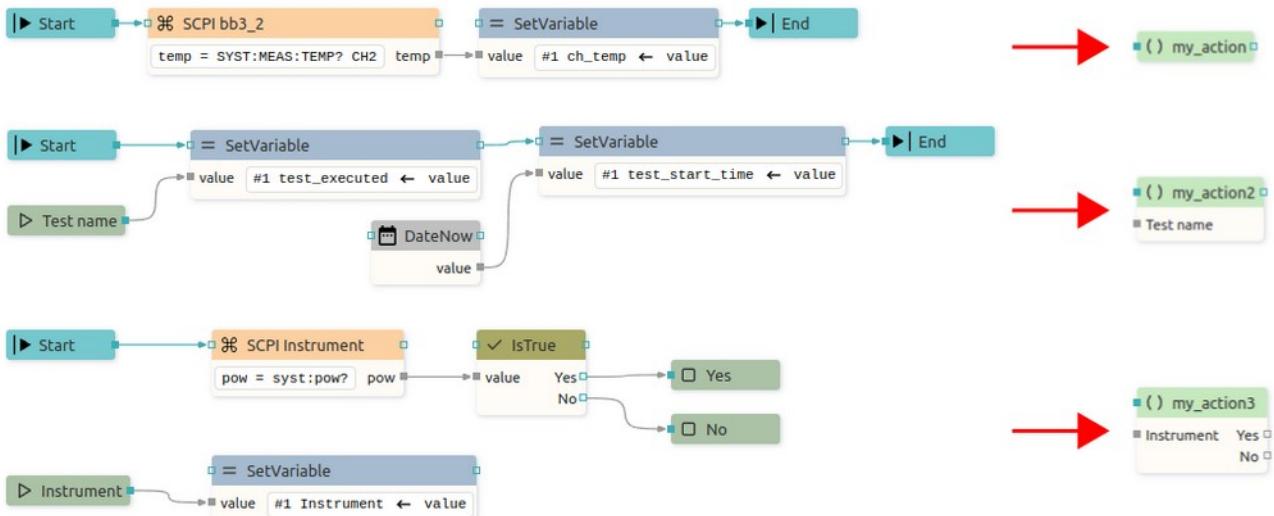

Fig. 75: User Action examples

## P8. Variables

A variable stores data that can be changed later on. Project with Flow support can have both global and local variables. Global variables are visible from all Flows, local variables are visible only inside the Flow in which it is defined.

Project without Flow support can have only global variables and those variables must be Native i.e. variables managed by the native code (written in C++).

To add variables, use the Variables panel (Fig. 76), when a dialog box will open for defining the basic parameters of the variable (*Name*, *Type* and *Default value*).

To edit the parameters of the variable selected in the *Variables* panel, use the *Properties* panel. In Fig. 77, Fig. 78 and Fig. 79 shows *Properties* panels for different types of variables from different types of projects.

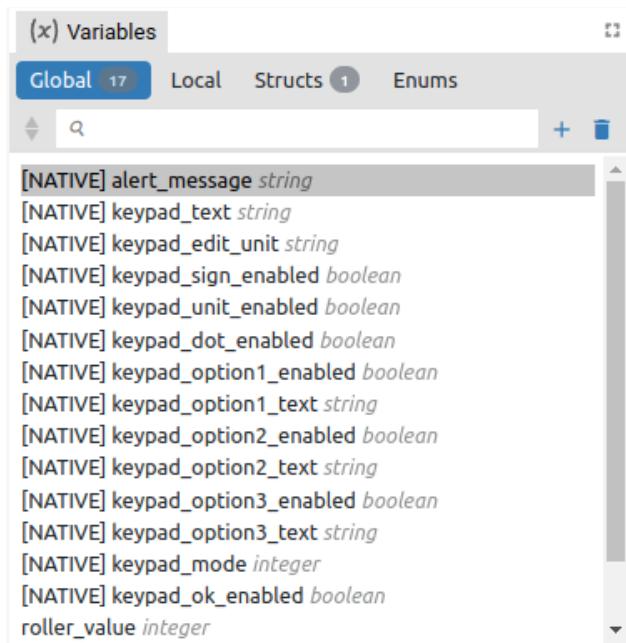

Fig. 76: Variables panel

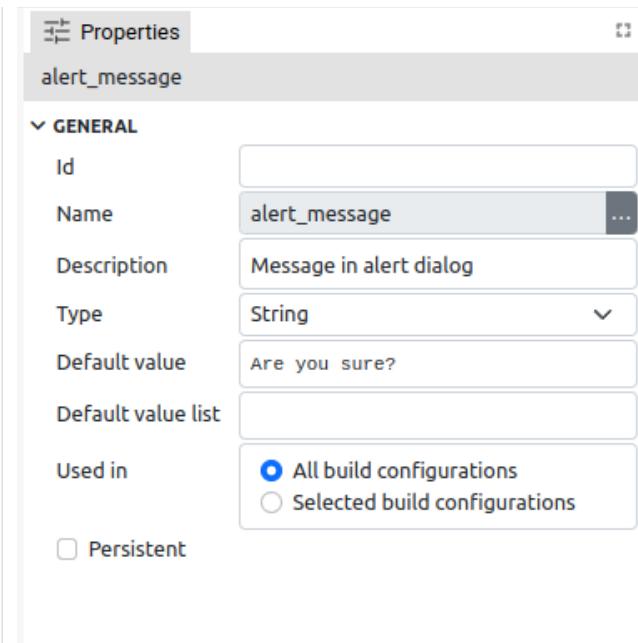

Fig. 77: Variable Properties panel (EEZ-GUI)

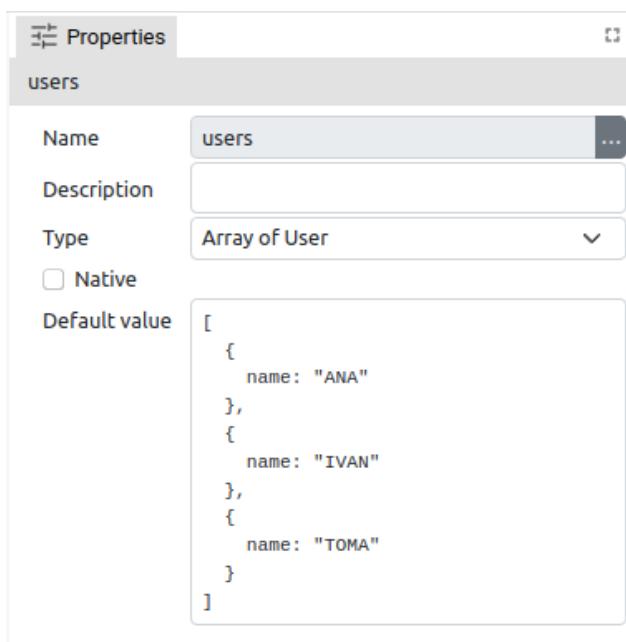

Fig. 78: Variable Properties panel (LVGL)

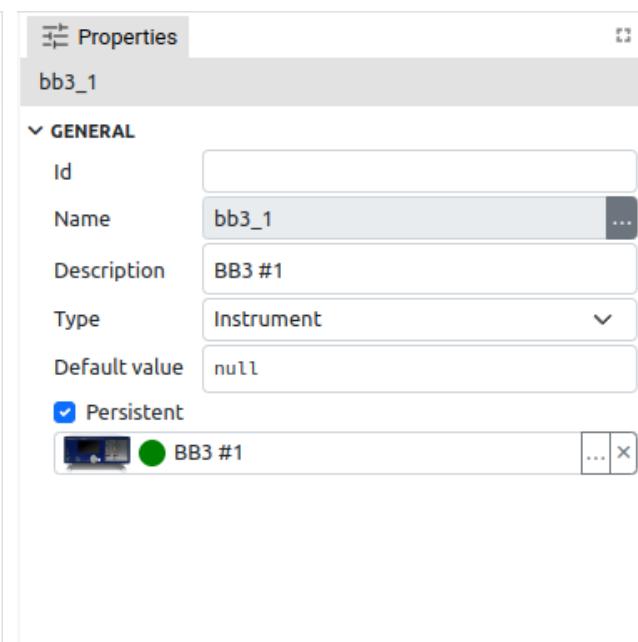

Fig. 79: Variable Properties panel (Dashboard)

Item	Description
<i>Id</i>	ID is <i>EEZ-GUI</i> project specific and is used in <i>Page</i> , <i>Action</i> , <i>Global Variable</i> , <i>Style</i> , <i>Font</i> , <i>Bitmap</i> and <i>Colors</i> . These are all resources that are referenced by name in the project editor. When that project is built, names are no longer used, but numerical IDs. This field is optional, i.e. an ID does not have to be specified, in which case an ID will be assigned during the build. However, if we want an object to always get the same ID, then it needs to be defined. Why would we want to always have the same ID? This is necessary when there is a master project such as <i>modular-psu-firmware.eez-project</i> from EEZ BB3 and that master project is used by BB3 Applets and BB3 MicroPython scripts and they can use resources from the master project that have that ID defined.
	<i>Important:</i> once the ID is set, it should not be changed, otherwise all BB3 scripts that depend on it should be rebuilt.
<i>Name</i>	Variable is referenced in other parts of project by its name. Rules for naming variables: Starts with a letter or an underscore (_), followed by zero or more letters, digits, or underscores. Spaces are not allowed.
<i>Description</i>	Optional field, contains a description of the variable.
<i>Type</i>	The type of data stored in variable. When adding a new variable, its suggested default value will depend on the selected type (0 for <i>Integer</i> , False for <i>Boolean</i> , etc.).
<i>Native</i>	The variable is managed by the native code (written in C++). A Dashboard project cannot have Native variables, and working with them is explained in Chapter XX.
<i>Default value</i>	Default value is the initial value of the variable when Flow starts. Given in JSON notation ( <a href="https://www.json.org/json-en.html">https://www.json.org/json-en.html</a> ).
	For example: 123, "Hello", true If types is struct: { "member1": 42, "member2": "Hello" } If type is array: [1, 2, 3] or ["string1", "string2", "string3"]
<i>Default value list</i>	Only supported in <i>EEZ-GUI</i> project that does not have EEZ Flow enabled.
<i>Used in</i>	See <i>Configurations</i> (Chapter P13.2.1) in project <i>Settings</i> .
<i>Persistent (Global variables only)</i>	Stores the last value of the variable in the <i>.eez-runtime-settings</i> file, so that next time projects will have this value, instead of the default value.
	Supported only in Dashboard projects.

### P8.1. Variables usage in the project with EEZ Flow enabled

Data stored in a variable can be accessed using expressions. The following Action components are used to work with variables:

- *Evaluate* – evaluates expression, which can use variables, and sends the result through "result" data line.
- *Watch* – monitors the change in the value of the variable. At Flow start, it always sends the current value via the Changed data flow line, and later every value change is sent.
- *SetVariable* – sets a new variable value. Multiple entries are allowed. Each entry contains a variable and an expression field. During Flow execution, the evaluated expression will be stored in a variable.
- *SwitchCase*, *Compare*, *IsTrue* – Actions used for branching in the Flow depending on the value of the variable

Variables are also used in Widget components. Certain Widget properties can be defined as an expression. In this case, the value of that property will change during Flow execution as the expression changes. For example, *Label* widget can show the content of some variable, and it will updated every time this variable has been modified.

## P8.2. Variable types

### P8.2.1. Basic/Primitive types

Item	Description
<i>Integer</i>	Signed 32-bit integer.
<i>Float</i>	IEEE 4-byte floating-point.
<i>Double</i>	IEEE 8-byte floating-point.
<i>Boolean</i>	Can hold true or false value.
<i>String</i>	Sequence of characters.
<i>Date</i>	Unix timestamp.
<i>Blob</i>	Binary large object (Dashboard projects only).
<i>Stream</i>	Stream of data (Dashboard projects only).
<i>Any</i>	Can hold any data type.

### P8.2.2. Structures

Structure types are defined in *Variables* panel in *Structs* section. Struct type variable stores multiple data values each accessed by its member name. Each member is defined by its name and type.

*Structures can only be used in projects that have EEZ Flow enabled.*

### P8.2.3. Enums

Enums types are defined in *Variables* panel in *Enums* section. Enum type variable stores integer data value, but can contain only restricted set of values. Each enum member is defined by its name and integer value.

### P8.2.4. Objects

Object variables, similar to structs, can hold multiple values, each accessed by member names. The member names depends of the type of Object variable. Example of object variables: Instrument connection or PostgreSQL connection. Object variables are described in more detail in Chapter XX.

*Object variables can only be used in Dashboard projects.*

### P8.2.5. Arrays

Array variable stores multiple data values.

### P8.2.6. Expressions

An expression contains instructions on how to evaluate a data value during Flow execution. An expression is defined in code similar to JavaScript or other C-like languages.

#### Expression element Description / Example

<i>Literal value</i>	Example: 42, "Hello", true
<i>Variable names</i>	Example: my_var
<i>Input names</i>	Retrieves the data stored in data input using the name of that input. Example: input_name
<i>Binary operator</i>	Example: my_integer_var + 1
<i>Logical operator</i>	Example: my_integer_var < 10
<i>Unary operator</i>	Example: -my_integer_var

<i>Ternary operator</i>	Example: <code>my_integer_var == 1 ? true : false</code> (evaluates to <code>true</code> if <code>my_integer_var</code> is 1, otherwise evaluates to <code>false</code> )
<i>Function calls</i>	Example: <code>String.length(my_string_var)</code>
<i>Parentheses "()"</i>	Specifying the order of the evaluation Example: <code>"Counter: " + (a + 1)</code>
<i>Accessor ":"</i>	Structure type member accessor by using ":" Example: <code>my_struct_var.member1</code>
<i>Accessor "[]"</i>	Array element accessor by using "[]" Example: <code>my_array_var[3], my_array_var[index]</code>
<i>Enum value</i>	Example: <code>MyEnumTypeName.Member1</code>

#### Expression examples:

``var[i].member1``  
`'var'` is array which contains structs, which has member `'member1'`  
`'i'` is integer variable  
evaluates to `'member1'` value in the i-th element

``var == State.START || var == State.EMPTY``  
`'var'` is of type enum:State, and State enum has two members: START and EMPTY  
evaluates to True if `var` contains data that is either `State.START` or `State.EMPTY`

#### P8.2.7. Literals

Type	Description / Example
<i>Integer</i>	<code>'42'</code>
<i>Float or double</i>	<code>'3.14'</code>
<i>String</i>	<code>'"Hello world!"'</code>
<i>Translated string</i>	<code>T"text_resource_id"</code> (prefix T is mandatory)
<i>Boolean</i>	<code>'true'</code> or <code>'false'</code>
<i>JSON</i>	See <a href="https://www.json.org/json-en.html">https://www.json.org/json-en.html</a>

#### P8.2.8. Binary Operators

Each binary operators requires two arguments. Binary operator is written between arguments, for example: `<arg1> + <arg2>`

#### Addition +

Rules:

- If any of the arguments is a string then result is a string. For example, `'voltage +"V"` will evaluate to `"1.5 V"` if data stored in voltage variable is `'1.5'`
- If any of the arguments is a double then result is a double.
- If one argument is a float and the other is a float or an integer the result will be a float.
- If both arguments are integers then result is an integer.

arg1\arg2	integer	float	double	string	boolean	other_type
<code>integer</code>	<code>integer</code>	<code>float</code>	<code>double</code>	<code>string</code>	<code>integer</code>	<code>err</code>
<code>double</code>	<code>double</code>	<code>double</code>	<code>double</code>	<code>string</code>	<code>double</code>	<code>err</code>

float	float	float	double	string	float	err

**P8.2.9. Logical operators**

Logical operators are also binary operators that result in Boolean values.

**Type      Description**

<code>==</code>	Equal to
<code>!=</code>	Not equal
<code>&lt;</code>	Greater than
<code>&gt;</code>	Less than
<code>&lt;=</code>	Less than or equal to
<code>&gt;=</code>	Greater than or equal to
<code>&amp;&amp;</code>	And
<code>  </code>	Or

**P8.2.10. Unary operators****Type      Description**

<code>-</code>	Negate the value
<code>~</code>	Binary invert
<code>!</code>	Logical invert

### P8.2.11. Conditional (ternary) operator

The conditional (ternary) operator is the only operator that takes three operands: a condition followed by a question mark (?), an expression to be executed if the condition is true followed by a colon (:), and finally an expression to be executed if the condition is false.

## P8.3. Functions

### P8.3.1. System

#### **System.getTick**

Retrieves the number of milliseconds that have elapsed since the flow execution was started.

#### Parameters

None

#### Return value

Value in milliseconds. Return type is `Integer`.

### P8.3.2. Flow

#### **Flow.index**

Index of current element in the List and Grid widget. Check the description of these two widget for the more information.

#### Parameters

Name	Type	Description
<code>index</code>	<code>Integer</code>	In case of nested List/Grid widgets use 0 for inner most List/Grid, 1 for List/Grid one up, etc.

#### Return value

Element index. Return type is `Integer`.

#### **Flow.isPageActive**

If this function is executed inside the page it will return true if that page is currently active page, otherwise it will return false.

#### Parameters

None

#### Return value

True if page is active, False if page is not active. Return type is `Boolean`.

#### **Flow.pageTimelinePosition**

If this function is executed inside the page or custom widget it will return the current position at the animation timeline for that page or custom widget.

#### Parameters

None

#### Return value

Timeline position. Return type is `Boolean`.

#### **Flow.makeValue**

Creates a new value of type Struct.

**Parameters**

Name	Type	Description
structName	String	Structure name.
value	JSON	Structure name.

**Return value**

Created struct value. Return type is `Struct`.

***Flow.makeArrayValue***

Creates a new value of type array.

**Parameters**

Name	Type	Description
value	JSON	Array value.

**Return value**

Created array value. Return type is `Array`.

***Flow.languages***

Retrieves a list of languages defined in multi-language project as array of strings.

**Parameters**

None

**Return value**

Array of languages. Return type is `Array:string`.

***Flow.translate***

Translate text resource ID, same as `T"textResourceID"`.

**Parameters**

Name	Type	Description
textResourceID	String	Text resource ID.

**Return value**

Translated string. Return type is `String`.

***Flow.parseInteger***

Parse integer value given as string.

**Parameters**

Name	Type	Description
str	String	Input string.

**Return value**

Parsed integer value. Return type is `Integer`.

***Flow.parseFloat***

Parse float value given as string.

**Parameters**

Name	Type	Description
str	String	Input string.

**Return value**

Parsed float value. Return type is `Float`.

### ***Flow.parseDouble***

Parse double value give as string.

#### **Parameters**

Name	Type	Description
<code>str</code>	<code>String</code>	Input string.

#### **Return value**

Parsed double value. Return type is `Double`.

## P8.3.3. Date

### ***Date.now***

Returns current date.

#### **Parameters**

None

#### **Return value**

Current datetime. Return type is `Now`.

### ***Date.toString***

Converts given date to string.

#### **Parameters**

Name	Type	Description
<code>str date</code>	<code>Date</code>	Input date.

#### **Return value**

Date string. Return type is `String`.

### ***Date.toLocaleString***

Converts given date to locale string.

#### **Parameters**

Name	Type	Description
<code>str date</code>	<code>Date</code>	Input date.

#### **Return value**

Date string. Return type is `String`.

### ***Date.fromString***

Converts string to date.

#### **Parameters**

Name	Type	Description
<code>dateStr</code>	<code>String</code>	Input string.

#### **Return value**

Date. Return type is `Date`.

### **Date.getYear**

Get year from date.

#### **Parameters**

Name	Type	Description
date	Date	Input date.

#### **Return value**

Year. Return type is Integer.

### **Date.getMonth**

Get month from date (1 to 12).

#### **Parameters**

Name	Type	Description
date	Date	Input date.

#### **Return value**

Month. Return type is Integer.

### **Date.getDay**

Get day of the month from date (1 to 31).

#### **Parameters**

Name	Type	Description
date	Date	Input date.

#### **Return value**

Day. Return type is Integer.

### **Date.getHours**

Get hours from date (0 to 23).

#### **Parameters**

Name	Type	Description
date	Date	Input date.

#### **Return value**

Hours. Return type is Integer.

### **Date.getMinutes**

Get minutes from date (0 to 59).

#### **Parameters**

Name	Type	Description
date	Date	Input date.

#### **Return value**

Minutes. Return type is Integer.

### **Date.getSeconds**

Get seconds from date (0 to 59).

#### **Parameters**

Name	Type	Description
date	Date	Input date.

**Return value**

Seconds. Return type is Integer.

**Date.getMilliseconds**

Get milliseconds from date (0 to 999).

**Parameters**

Name	Type	Description
date	Date	Input date.

**Return value**

Milliseconds. Return type is Integer.

**Date.make**

Make a date from arguments.

**Parameters**

Name	Type	Description
year	Integer	Year
month	Integer	Month
day	Integer	Day
hours	Integer	Hours
minutes	Integer	Minutes
seconds	Integer	Seconds
milliseconds	Integer	Milliseconds

**Return value**

Constructed date. Return type is Date.

**P8.3.4. Math****Math.sin**

Returns the sine of a number in radians.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number representing an angle in radians.

**Return value**

The sine of x, between -1 and 1, inclusive. Return type is Float|Double.

**Math.cos**

Returns the cosine of a number in radians.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number representing an angle in radians.

**Return value**

The cosine of x, between -1 and 1, inclusive. Return type is Float|Double.

***Math.pow***

Returns the value of a base raised to a power.

**Parameters**

Name	Type	Description
base	Integer Float Double	Year
exponent	Integer Float Double	Month

**Return value**

A number representing base taken to the power of exponent. Return type is `Float|Double`.

***Math.log***

Returns the natural logarithm (base e) of a number.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number greater than or equal to 0.

**Return value**

The natural logarithm (base e) of x. Return type is `Float|Double`.

***Math.log10***

Returns the base 10 logarithm of a number.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number greater than or equal to 0.

**Return value**

The base 10 logarithm of x. Return type is `Float|Double`.

***Math.abs***

Returns the absolute value of a number.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number.

**Return value**

The absolute value of x. If x is negative (including -0), returns -x. Otherwise, returns x. The result is therefore always a positive number or 0. Return type is `Integer|Float|Double`.

***Math.floor***

Always rounds down and returns the largest integer less than or equal to a given number.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number.

**Return value**

The largest integer smaller than or equal to x. It's the same value as `-Math.ceil(-x)`. Return type is `Integer|Float|Double`.

***Math.ceil***

Always rounds up and returns the smaller integer greater than or equal to a given number.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number.

**Return value**

The smallest integer greater than or equal to x. It's the same value as `-Math.floor(-x)`. Return type is Integer|Float|Double.

***Math.round***

Returns the value of a number rounded to the nearest integer.

**Parameters**

Name	Type	Description
x	Integer Float Double	A number.

**Return value**

The value of x rounded to the nearest integer. Return type is Integer|Float|Double.

***Math.min***

Returns the smallest of the numbers given as input parameters.

**Parameters**

Name	Type	Description
value1, ..., valueN	Integer Float Double	Zero or more numbers among which the lowest value will be selected and returned.

**Return value**

The smallest of the given numbers. Return type is Integer|Float|Double.

***Math.max***

Returns the largest of the numbers given as input parameters.

**Parameters**

Name	Type	Description
value1, ..., valueN	Integer Float Double	Zero or more numbers among which the largest value will be selected and returned.

**Return value**

The largest of the given numbers. Return type is Integer|Float|Double.

**P8.3.5. String*****String.length***

Returns the length of the string.

**Parameters**

Name	Type	Description
string	String	A string.

**Return value**

The length of a string. Return type is Integer.

***String.substring***

Returns the part of the string from the start index up to and excluding the end index, or to the end of the string if no end index is supplied.

**Parameters**

Name	Optional	Type	Description
string		String	A string.
start		String	The index of the first character to include in the returned substring.
end	Yes	String	The index of the first character to exclude from the returned substring.

**Return value**

A new string containing the specified part of the given string. Return type is `String`.

***String.find***

Searches a string and returns the index of the first occurrence of the specified substring.

**Parameters**

Name	Type	Description
string	String	A string.
substring	String	Substring to search for.

**Return value**

The index of the first occurrence of substring found, or -1 if not found. Return type is `String`.

***String.padStart***

Pads the current string with another string (multiple times, if needed) until the resulting string reaches the given length.

**Parameters**

Name	Type	Description
string	String	A string.
targetLength	Integer	The length of the resulting string once the current str has been padded. If the value is less than or equal to str.length, then str is returned as-is.
padString	String	The string to pad the current str with. If padString is too long to stay within the targetLength, it will be truncated from the end.

**Return value**

A String of the specified targetLength with padString applied from the start. Return type is `String`.

***String.split***

Takes a separator parameter and divides a String into an ordered list of substrings by searching for the separator pattern, puts these substrings into an array, and returns the array.

**Parameters**

Name	Type	Description
string	String	A string.
separator	Integer	The pattern describing where each split should occur.

**Return value**

An Array of strings, split at each point where the separator occurs in the given string. Return type is `Array:string`.

## P8.3.6. Array

### **Array.length**

The number of elements in given array.

#### Parameters

Name	Type	Description
array	Array	An array.

#### Return value

The length of an array. Return type is Integer.

### **Array.slice**

Returns a shallow copy of a portion of an array into a new array object selected from start to end (end not included) where start and end represent the index of items in that array. The original array will not be modified.

#### Parameters

Name	Optional	Type	Description
array		Array	An array.
start		Integer	Zero-based index at which to start extraction.
end	Yes	Integer	Zero-based index at which to end extraction.

#### Return value

A new array containing the extracted elements. Return type is Array.

### **Array.allocate**

Creates a new array of given size.

#### Parameters

Name	Type	Description
size	Array	A size number.

#### Return value

A new array. Return type is Array.

### **Array.append**

Takes a separator parameter and divides a String into an ordered list of substrings by searching for the separator pattern, puts these substrings into an array, and returns the array.

#### Parameters

Name	Type	Description
array	Array	An array.
value	Any	Element value to be appended.

#### Return value

A new array with appended element. Return type is Array.

### **Array.insert**

Inserts an element to an existing array at given position and returns a new array. The original array will not be modified.

#### Parameters

Name	Type	Description

<code>array</code>	<code>Array</code>	An array.
<code>position</code>	<code>Integer</code>	Zero-based index at which new element will be inserted.
<code>value</code>	<code>Any</code>	Element value to be inserted.

**Return value**

A new array with inserted element. Return type is `Array`.

**`Array.remove`**

Removes from an existing array an element at given position and returns a new array. The original array will not be modified.

**Parameters**

Name	Type	Description
<code>array</code>	<code>Array</code>	An array.
<code>position</code>	<code>Integer</code>	Zero-based index from which existing element will be inserted.

**Return value**

A new array with element removed. Return type is `Array`.

**`Array.clone`**

Deep clone of the array.

**Parameters**

Name	Type	Description
<code>array</code>	<code>Array</code>	An array.

**Return value**

A new array. Return type is `Array`.

**P8.3.7. LVGL****`LVGL.MeterTickIndex`**

See the LVGL Meter Widget description (Chapter W33) for the purpose of this function.

**Parameters**

None

**Return value**

Index number. Return type is integer.

**P8.4. Expression Builder**

Expressions are supported in both Action and Widget components. Each property of component that can be evaluated from the expression has "..." icon which opens *Expression Builder* (Fig. 80). Expressions can be entered manually or using the *Expression Builder*.

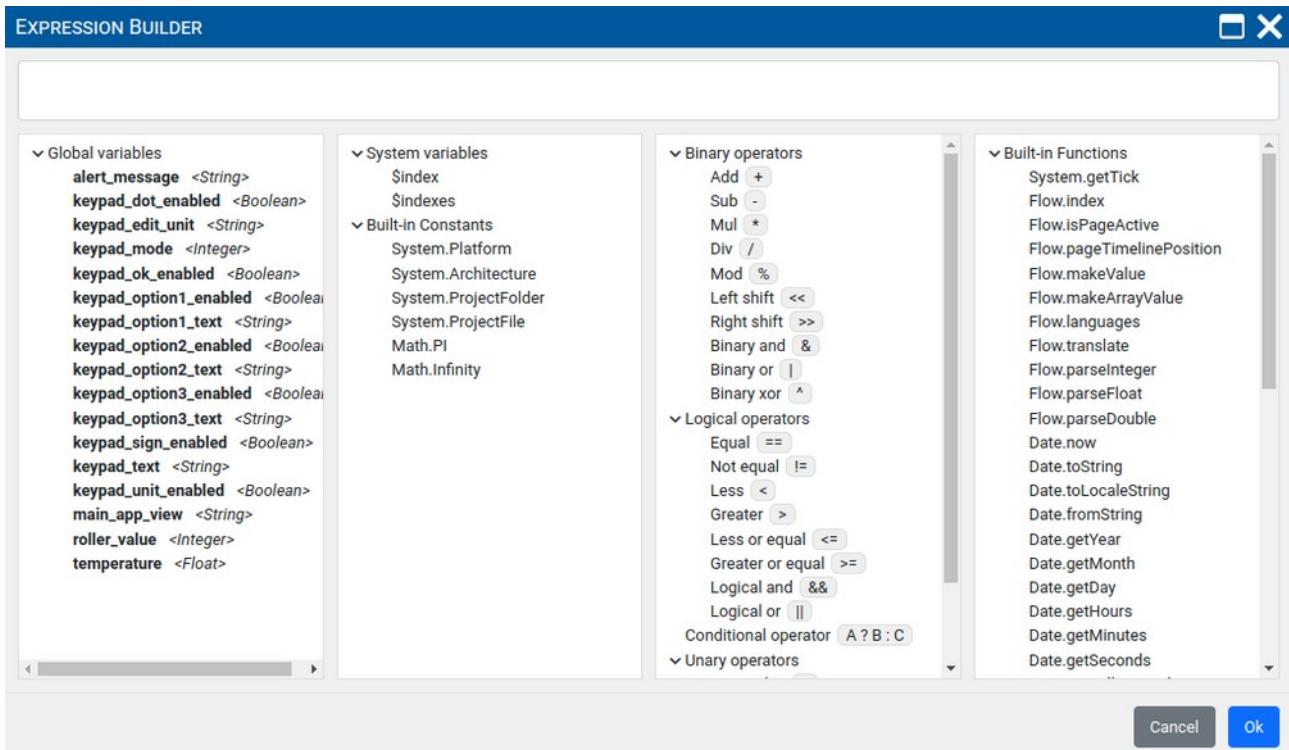

Fig. 80: Expression builder

## P9. Styles and Color themes

### P9.1. Overview

Styles make it easy to define a whole range of visual attributes and unify the appearance of widgets. Style attributes can be set at multiple levels, i.e. there are multiple scopes.

The base level/scope is Local: all style attributes will only apply to that Widget. When we want to use the same style on several Widgets, we can use the Project style defined in the *Styles* panel.

By using Project styles, instead of local style modifications, consistency is achieved (Widgets of similar purpose have the same visual appearance) and sustainability (a change to an attribute in a Style used by multiple Widgets is automatically propagated to all Widgets that use it).

Style attributes are inherited, which means that one attribute of a Style can inherit attribute from another Style. i.e. the Child style inherits all properties of the Parent style.

Additionally, all style attributes that contain a color definition can inherit the color from the *Color Theme* as explained in Section P9.4.2

### P9.2. Style properties

Fig. 81 shows how for the selected widget (1) the locally defined style parameters can be found in the *Style* subsection (2) within the widget *Properties* panel.

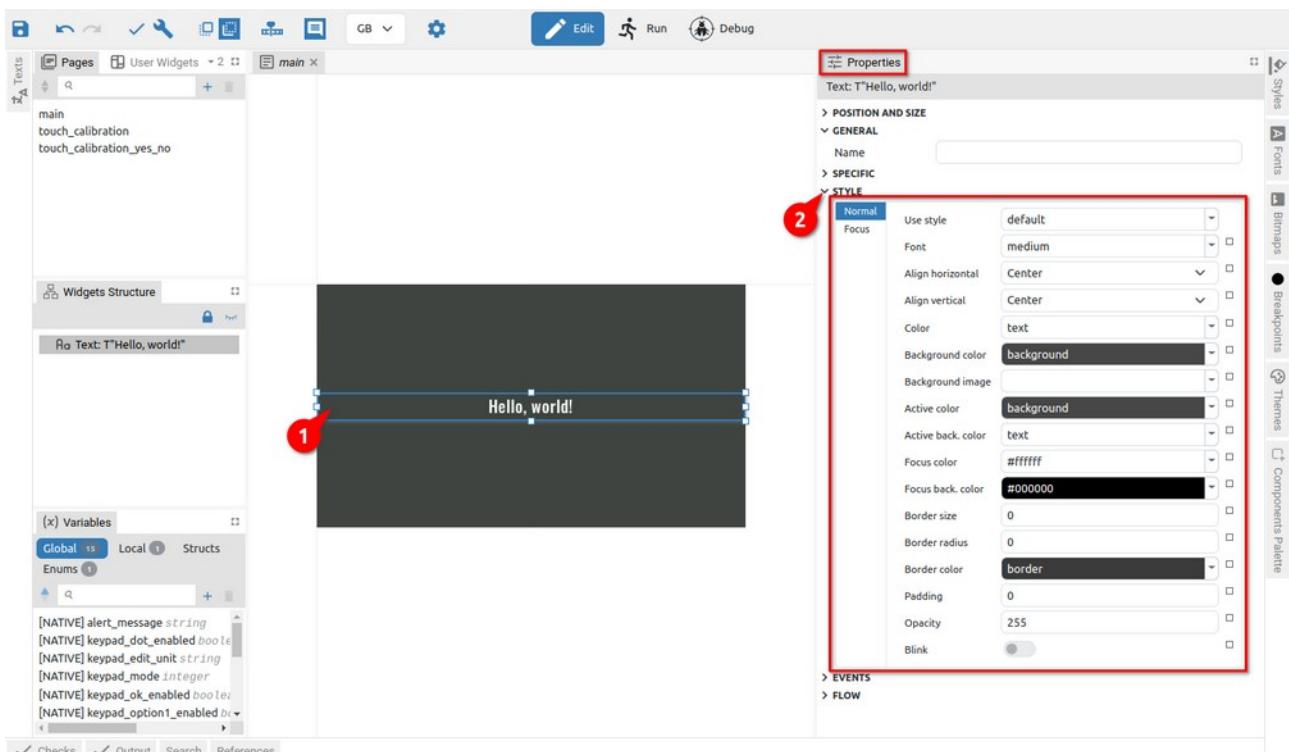

Fig. 81: Selected widget Style section for EEZ-GUI project type

The number of attributes and the appearance of the *Style* section depends on the project type in which the widget is used. In Fig. 81 the *Style* section for the *EEZ-GUI* project type is shown. Fig. 82 shows an example of the *Style* for the `Button` widget in the *Dashboard* project, and Fig. 83 example *Style* for `Label` widget in *LVGL* project.

The number of style attributes varies by Widget type and Project type. Widgets that can have multiple states (`Default`, `Focused`, `Disabled`, ...) will be able to define style attributes separately for all states.

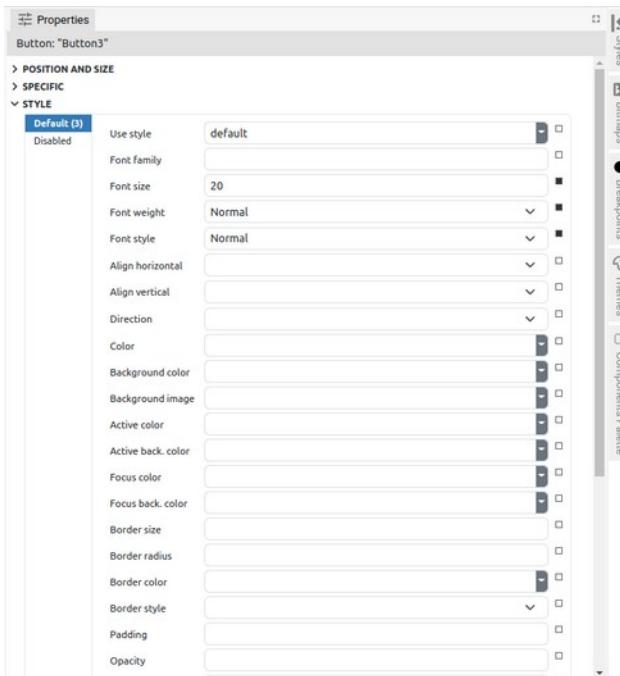

Fig. 82: Style properties (Dashboard project)

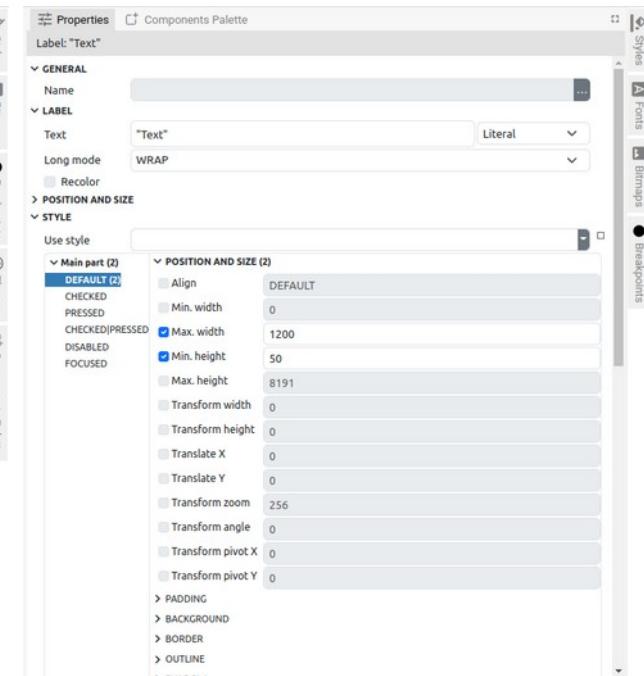

Fig. 83: Style properties (LVGL project)

### P9.3. Project Styles

As shown in Fig. 81, Project styles have their own panel (1) where they can be searched, added and deleted. For the selected Project style, all properties will be displayed in the Properties panel, i.e. the same one used to display Widget and Action properties (5), and the name of the selected Style is displayed at the top (4).

Below the list of Project styles, a preview is shown. *EEZ-GUI* project styles have two previews: the first when `Color / Background Color` is used (2), and the second when `Active Color / Active back. color` is used (3). In Fig. 85 the preview section for the *LVGL* project is shown (6).

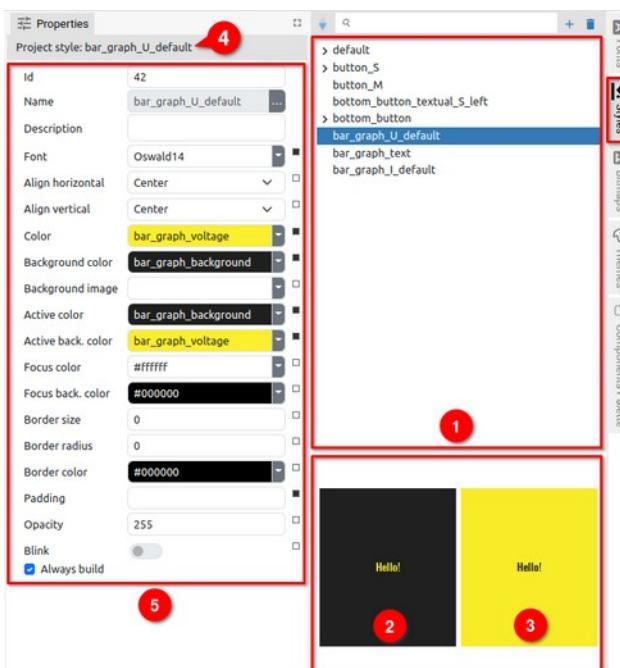

Fig. 84: Project Style Panel and Properties

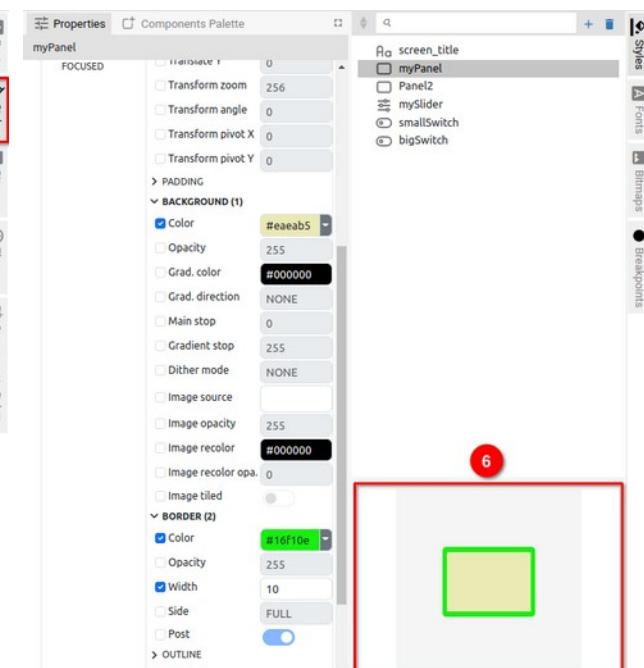

Fig. 85: LVGL Project style

### P9.3.1. Creating a new Style

When creating a new Project style, it will be necessary to define the *Name* (Fig. 86) that must be unique. In the *LVGL* project, it will be necessary to choose for which Widget type it will be applied (Fig. 87).

Fig. 86: Adding a new Style

Fig. 87: Adding a new Style (LVGL)

A new Project style can be conveniently created directly from the local style of the selected Widget using the *Create New Style* option from the popup menu of the *Use Style* attribute (Fig. 88).

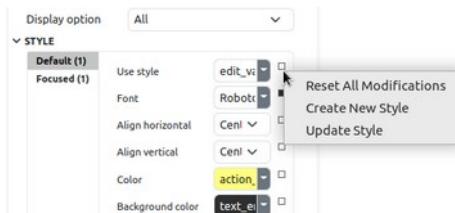

Fig. 88: Add new Style from currently selected Widget

Item	Description
<i>Reset All Modification</i>	Resetting (clearing) all local changes.
<i>Create New Style</i>	Creating a new Project style using the style settings of the currently selected Widget (opens a dialog box for creating a new Project style as in Fig. 86 or Fig. 87). After successful creation of the Style, it will be assigned to the selected Widget, too.
<i>Update Style</i>	The Project style used by the Widget will be updated with local modifications. Therefore the local modifications will be applied to all other Widgets that use the same Project style.

### P9.4. Style hierarchy

Project styles can inherit properties, so a "child" style inherits all the properties of its "parent". The "Child-parent" relationship is shown in the Project style sheet, where changing the position sets or resets the "child" relationship. Inheritance can be multi-level, i.e. one "child" can become the parent of another "child". For example, in Fig. 89 Style *edit\_value\_active\_M\_center* has two child Styles (1): *edit\_value\_active\_S\_center* and *edit\_value\_active\_M\_left*. Child *edit\_value\_active\_S\_center* is the parent of two other child Styles (2): *icon\_and\_text\_S* and *edit\_value\_active\_S\_center\_icon*.

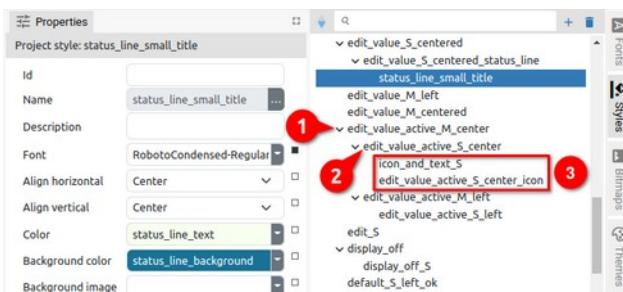

Fig. 89: Styles hierarchy

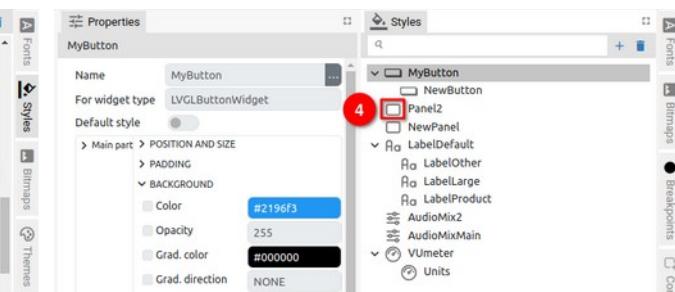

Fig. 90: Styles hierarchy in LVGL project

Since the Project styles in the *LVGL* project also have a Widget type defined, it is possible to establish

a "child-parent" relationship only between styles for the same Widget type. For this reason, in the Style Panel of the *LVGL* project (Fig. 90), an icon of the Widget type is displayed (4) in addition to the name of the Style, so that there is no need to guess whether the selected Style can become a child of a certain Parent or not.

Setting the Style as child is easily achieved with drag & drop as shown in Fig. 91: click and hold the Style you want to become a child (1); drag to the Style that will be the parent until the navigation line appears (2). Move the cursor to the right so that the beginning of the line is indented relative to the name of the parent Style. Finally, make drop and Style will appear indented and below its parent (3).

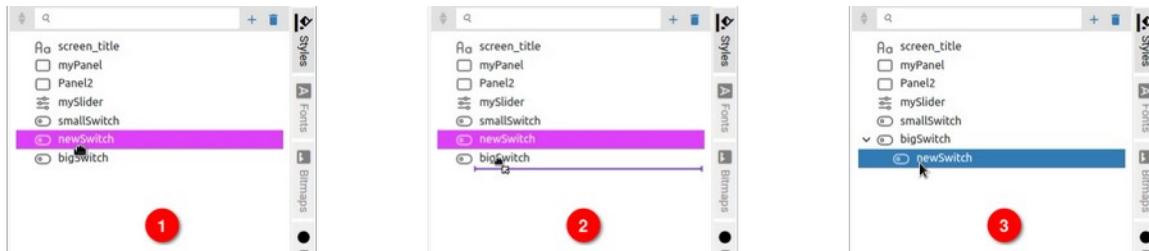

Fig. 91: Set child Style position

Resetting the child position is also carried out with drag & drop as shown in Fig. 92.

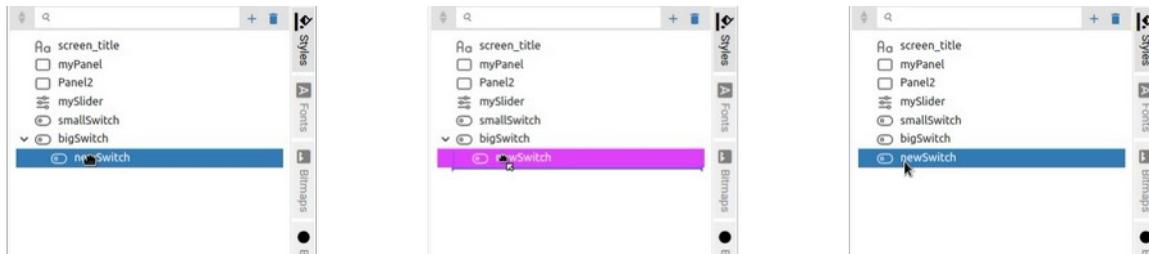

Fig. 92: Reset child Style position

#### P9.4.1. Setting the Style attribute color from the palette

A style can contain multiple attributes that define the color of a Widget part. Setting the color can be done in two ways and the first is by using the Color picker.

Fig. 93: Selecting a Style in the Style panel

Fig. 94: Setting the Style attribute color

In Fig. 93 and Fig. 94 shows how it can be done for the Project style: the style should be selected in

the list (1) when its name will appear in the Properties panel (2). The attribute to which we want to set the color should be clicked on (3) to open the Color picker. By moving the cursor around the palette, we select a color whose hex and RGB value is simultaneously displayed in the lower section through which it is also possible to directly enter the desired hex or RGB value.

#### P9.4.2. Setting the Style attribute color using the Color theme

Another way to set the attribute color is by using the Color theme. The color theme must be selected from the Theme panel (1) and in the Styles panel select the Project style to which we want to set the color attribute.

Fig. 95: Selecting a Style in the Style panel

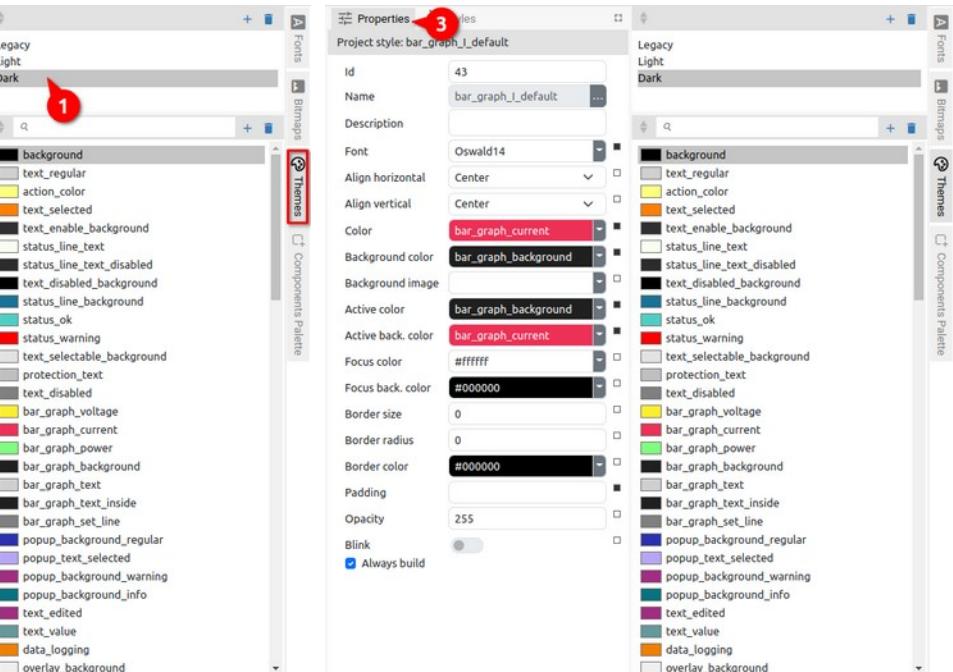

Fig. 96: Displaying the properties of the selected Style

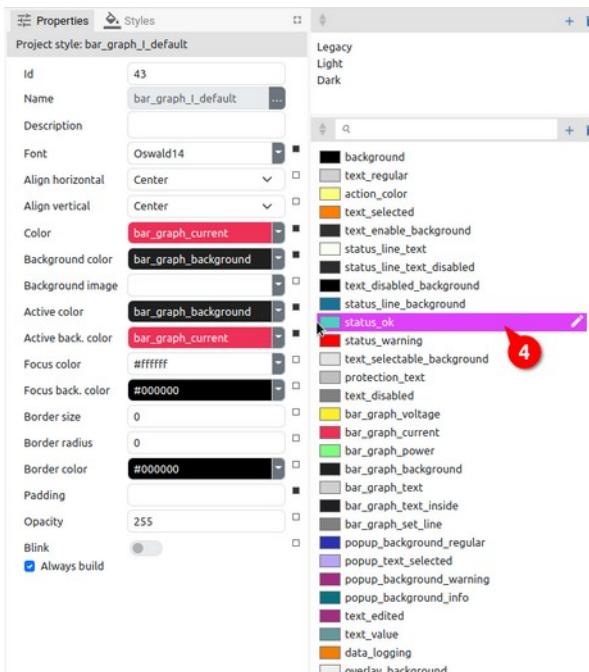

Fig. 97: Selecting a color from the Color theme

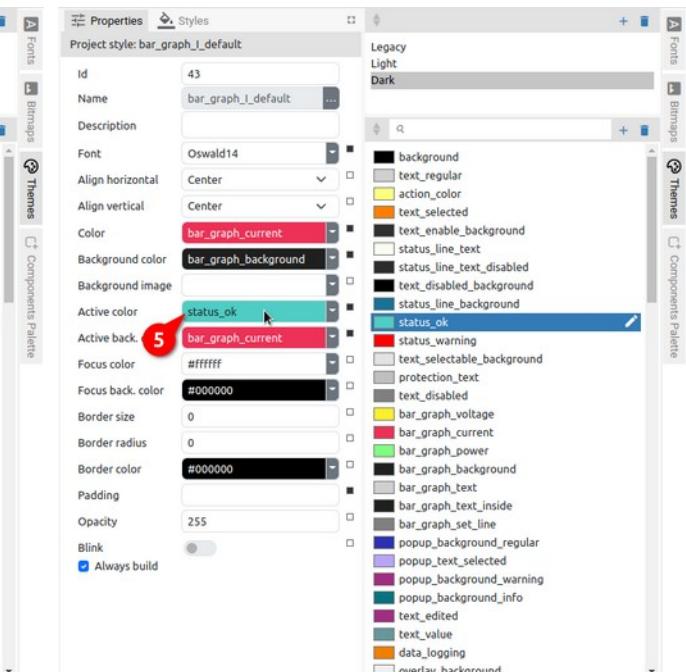

Fig. 98: Changing the color of the Style attribute

Now we need to select the Properties panel (3) in which all the attributes of the selected Style will be displayed. In the Theme panel, select the color (4) that we want to assign to the Style attribute and use drag and drop to place it in the name field of the attribute (5).

The attribute color can also be set by entering the name of the color from the Color theme, in our example it would be *status\_ok*.

## P9.5. Style attributes

### P9.5.1. EEZ-GUI project

In Fig. 99 shows a LineChart widget that has several style definitions: Normal, Title, Legend, X axis, Y axis and Marker (1). The first attribute Use style (2) determines from which Project style the attributes will be inherited and it can be defined separately for each of the style definitions.

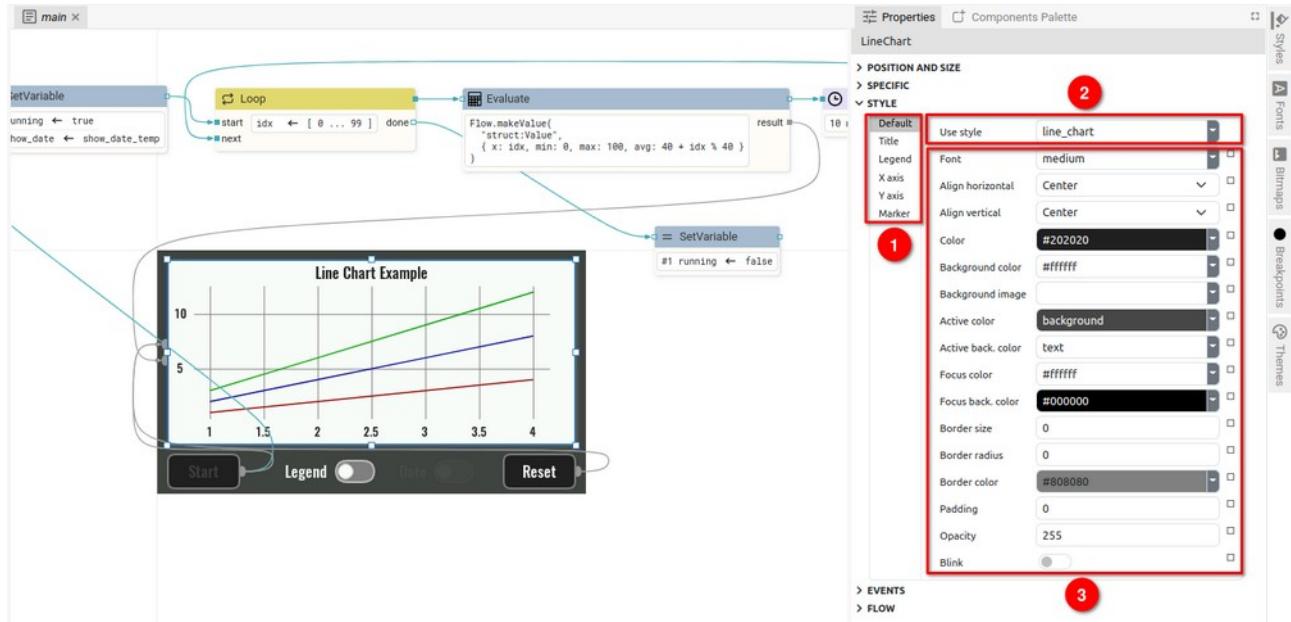

Fig. 99: EEZ-GUI project local Style attributes

Changing the Use style immediately propagates the attributes of the selected Project style to the corresponding attributes of the widget (3). All attributes listed below that contain a color value is either a hex color definition (e.g. #4beef2) or a color name as defined in the Color theme.

Item	Description
Use style	The name of the Style from which this widget inherits style attributes. If there is some locally modified attribute then it has precedence over this style definition. This attribute can be left empty, which means that this widget doesn't inherit any attribute from other Style and only local settings are used.
Font	The font for the texts displayed inside this Widget.
Align horizontal	Horizontal text alignment.
Align vertical	Vertical text alignment.
Color	The color of the text.
Background color	The background color of the Widget.
Background image	The background image of the Widget.
Active color	The color of the text when Widget is active. For example: <ul style="list-style-type: none"> <li>• <i>Button</i> widget is active when it is clicked</li> <li>• when <i>Blink</i> property is enabled in <i>Text</i> widget it switches periodically between <i>Normal</i> and <i>Active</i> state.</li> </ul>
Active back. color	The background color of the Widget when it is active.

`Focus color``Focus back. color``Border size``Border radius`

The color of the text when Widget is in focus.

The background color of the Widget when it is in focus.

The line width used to draw the border.

The radius of the border corner. It can be given as 1, 2 or 4 numbers separated by a space, with the following meaning:

- `radius` – sets the same radius value for all corners
- `radius1 radius2` – sets different radii for top-left / bottom-right corner (`radius1`) and for top-right / bottom-left corner (`radius2`)
- `radius1 radius2 radius3 radius4` – sets different values for each corner in this order: top-left, top-right, bottom-right, and bottom-left.

`Border color`

The color used to paint the border.

Below are examples of different borders:

`Padding`

The offset of the text. It can be given as 1, 2 or 4 numbers separated by a space, with the following meaning:

- `padding` – set the same number for all the sides
- `padding1 padding2` – `padding1` is for top / bottom and `padding2` is for left / right.
- `<padding1> <padding2> <padding3> <padding4>` – sets different values for each side in this order: top, right, bottom, and left.

`Opacity`

`0` – fully transparent, `255` – fully opaque.

`Blink`

If enabled, the Widget periodically switches between *Normal* and *Active* State. Use different normal and active colors to achieve blink effect.

## P9.5.2. Dashboard project

Dashboard project styles are based on CSS styles: <https://developer.mozilla.org/en-US/docs/Web/CSS>. The `Use style` attribute has the same function as in the EEZ-GUI project.

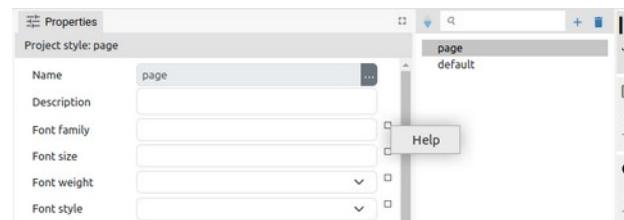

Fig. 100: Style attribute help

For each Style attribute, there is a *Help* link (Fig. 100) to open the corresponding help page for CSS properties on Mozilla's website. You can consult the CCS documentation for an explanation of the following attributes:

- Font family
- Font weight
- Font style
- Align horizontal
- Align vertical
- Direction
- Color
- Background color
- Background image
- Active color
- Active back. color
- Focus color
- Focus back. color
- Border size
- Border radius
- Border style
- Padding
- Opacity
- Box shadow

Use `Blink` attribute (1) to achieve Widget blinking (Fig. 101). The generated CSS can be checked in the `CSS preview` (2) when this attribute is enabled. Use `Additional CSS` section to enter any custom CSS properties (3).

Fig. 101: Dashboard style blink attribute

In `CSS preview`, which is a read-only section, there is a summary of the all CSS properties generated for the Style, including parent styles and local modifications (commented as `/* inline style */`).

### P9.5.3. LVGL project

Style definition in *LVGL* project are grouped in *Parts*, *States* and *Categories*. Each Widget type can have different *Parts* which can be differently customized with the *Styles*.

In the example from Fig. 102 `Slider` widget shown has three different *Parts*: `Main`, `Indicator` and `Knob` (1). For each *Parts*, it is possible to separately define the attributes of six possible *States*: `Default`, `Checked`, `Pressed`, `Checked|Pressed`, `Disabled` and `Focused` (2). Finally, for each *State* it is possible to define 72 attributes that are grouped into 11 *Categories* i.e. `Position` and `Size`, `Padding`, `Background`, ... (3).

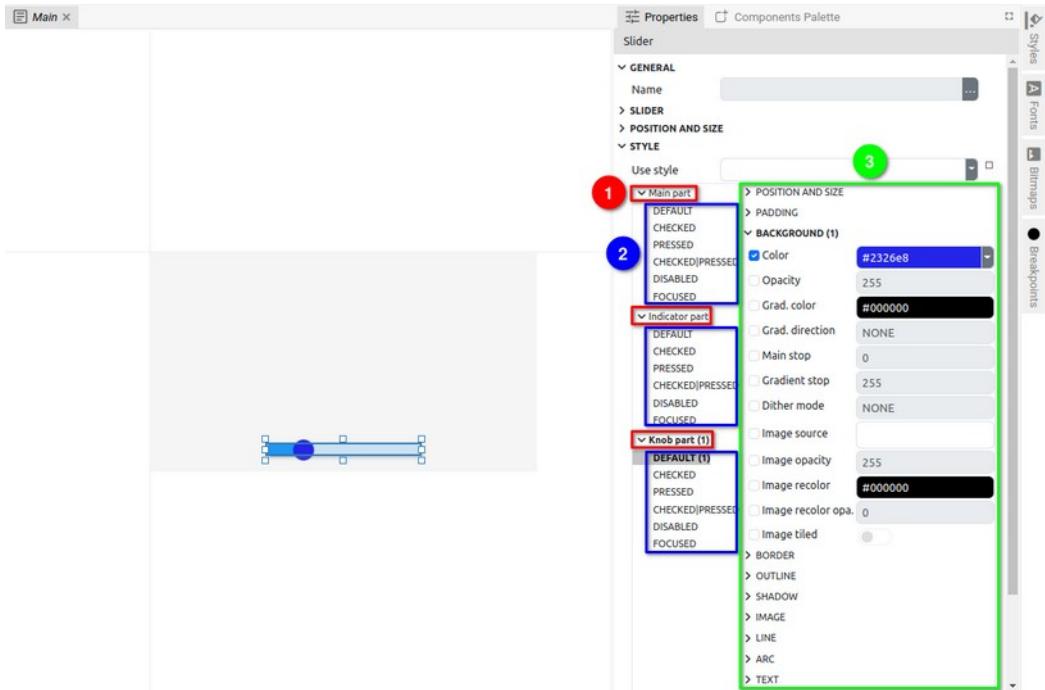

Fig. 102: LVGL project local Style attributes

Unlike the *EEZ-GUI* and *Dashboard* projects, LVGL Style attributes are changed by checking the checkbox to the left of the attribute name.

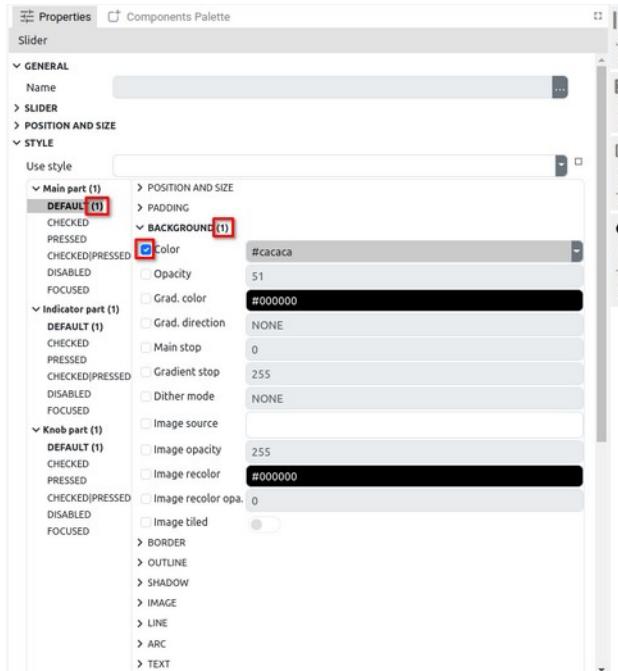

Fig. 103: Indication of modified attributes

In the category name, state name and part name there is an indication how many properties are changed (Fig. 103).

You can find out more about LVGL widget styles on the official pages of the *LVGL* project: <https://docs.lvgl.io/latest/en/html/overview/style.html>.

In the subsection <https://docs.lvgl.io/latest/en/html/overview/style.html#properties> there is a list with explanations of each attribute (i.e. properties).

### P9.5.4. Inheriting local Style attributes

In Section P9.3.1 it was mentioned that local style can be used to create Project style (which can be assigned to other Widgets). Likewise, `Use style` is used to set a local style from the list of Project styles defined through the Style panel (Fig. 104). In the case of an LVGL project where the Project style refers to a specific Widget type, a list of only those Project styles for the corresponding Widget type will be displayed (Fig. 105).

In addition to the selection from the list, the style can also be set by directly entering a valid name (case sensitive).

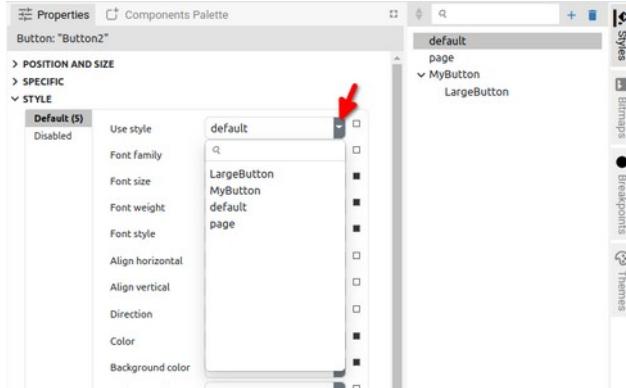

Fig. 104: Set a style from the Project style list

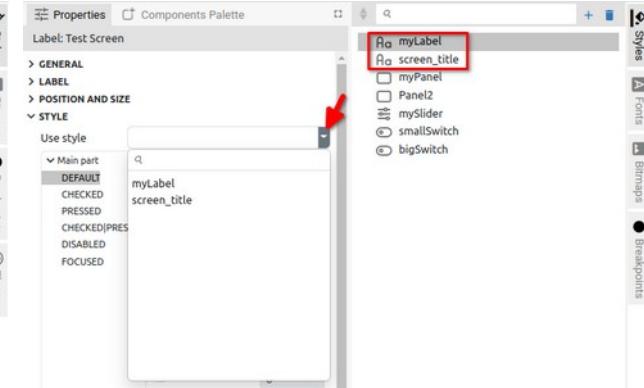

Fig. 105: Set a style from the Project style list (LVGL)

In the *EEZ-GUI* and *Dashboard* project type, on the right side of each attribute there is an indicator whether the attribute has been locally changed (filled square, see Fig. 106) or not (empty square). In the latter case, the name of the Project style whose attributes it inherited will be displayed at the mouse hover (Fig. 107).

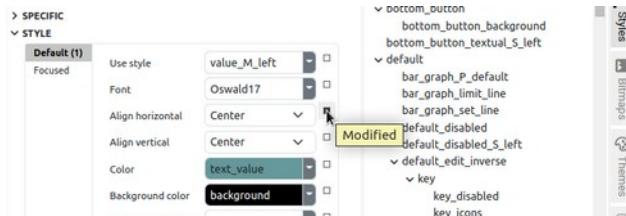

Fig. 106: Modified Style attribute indication

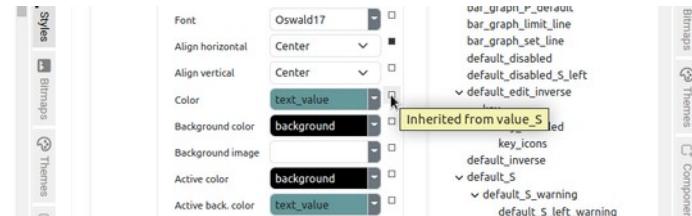

Fig. 107: Inherited Style attribute indication

An attribute that has been changed can be reverted to the original value it inherited from the set style. For this, it is necessary to select the *Reset* option from the popup menu on the indicator (Fig. 108). In case the attribute defines a background color, an option to set a transparent background will also appear in the menu as shown in Fig 109.

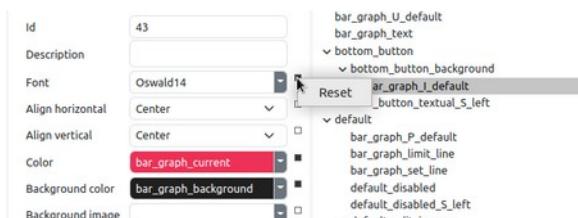

Fig. 108: Reset local style modification

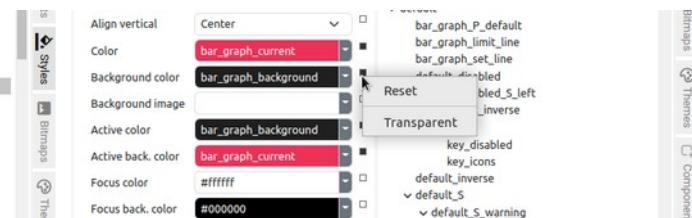

Fig. 109: Reset local style modification (Background)

## P10. Bitmaps

In Fig. 110 shows the *Bitmap* panel (1) in which there is a list of bitmaps that can be used in the project. The project can contain an unlimited number of bitmaps, and for the selected bitmap (2) you can see the size in pixels (3) and image preview (4).

Fig. 110: Bitmap panel

### P10.1. Adding a bitmap

When adding a bitmap, a new dialog opens with a different number of parameters depending on the type of project. Fig. 111 shows the dialog for *EEZ-GUI*, Fig. 112 shows the *Dashboard* and Fig. 113 shows the *LVGL* project.

Fig. 111: Add new bitmap in EEZ-GUI project

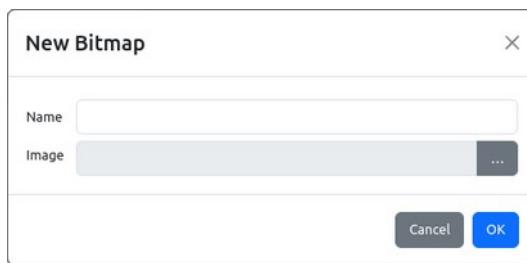

Fig. 112: Add new bitmap in Dashboard project

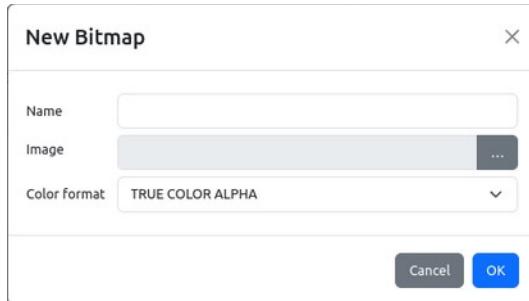

Fig. 113: Add new bitmap in LVGL project

Item	Description
Name	Bitmap is referenced in other parts of project by its name.
Image	Selection of bitmap file from local storage.
Bits per pixel (EEZ-GUI only)	Color depth: 16 (RGB565) or 32 (RGBA, i.e. 24-bit color + Alpha channel).
Color format (LVGL only)	Described in <a href="https://docs.lvgl.io/8.3/overview/image.html#color-formats">https://docs.lvgl.io/8.3/overview/image.html#color-formats</a>

## P10.2. Bitmap properties

Fig. 114 shows the properties for the bitmap from the *Bitmap* Panel for the EEZ-GUI project. The parameters are described in the following table.

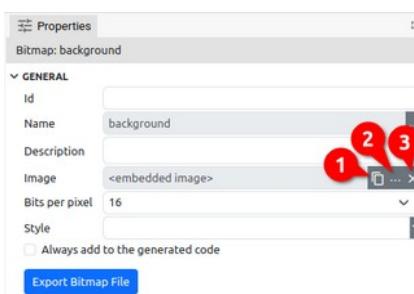

Fig. 114: Bitmap properties (EEZ-GUI)

Item	Description
<i>Id</i> (EEZ-GUI only)	<i>Bitmap</i> is one of resources that is referenced by name in the project editor. When that project is built, names are no longer used, but numerical ID. This field is optional, i.e. an ID does not have to be specified, in which case an ID will be assigned during the build. However, if we want an object to always get the same ID, then it needs to be defined. Why would we want to always have the same ID? This is necessary when there is a master project such as <i>modular-psu-firmware.eez-project</i> from EEZ BB3 and that master project is used by BB3 Applets and BB3 MicroPython scripts and they can use resources from the master project that have that ID defined.  <i>Important:</i> once the ID is set, it should not be changed, otherwise all BB3 scripts that depend on it should be rebuilt.
<i>Name</i>	Bitmap is referenced in other parts of project by its name. Use the ... button to change the existing name.
<i>Description</i>	Optional field, contains a description of the bitmap.
<i>Image</i>	This is the image file itself that is saved within the project file (embedded within project file). Options for Copy to clipboard (1), Paste from clipboard (2) and loading from local storage (3) are also available.

<i>Bits per pixel (EEZ-GUI only)</i>	16 – RGB565 32 – RGBA																																
<i>Style (EEZ-GUI only)</i>	The option is only enabled if <i>Bits per pixel</i> is set to 16. Only the background color from the entire style is used. If there is a transparent pixel in the default bitmap, then the background color will be displayed.																																
<i>Always add to the generated code (EEZ-GUI only)</i>	During the project build, i.e. when the source code is generated, only those Bitmaps that are used in the project will be inserted into the source code. However, if a bitmap is used within the native code but not in the EEZ Studio project, then using this option you can force the bitmap to be added to the source code even though it is not used in the project.																																
<i>Color format (LVGL only)</i>	Described in <a href="https://docs.lvgl.io/8.3/overview/image.html#color-formats">https://docs.lvgl.io/8.3/overview/image.html#color-formats</a> Below are the LVGL constant names and their counterparts used in EEZ Studio.																																
<table border="0"> <thead> <tr> <th><b>LVGL constant name</b></th> <th><b>EEZ Studio value</b></th> </tr> </thead> <tbody> <tr> <td>LV_IMG_CF_ALPHA_1_BIT</td> <td>ALPHA 1 BIT</td></tr> <tr> <td>LV_IMG_CF_ALPHA_2_BIT</td> <td>ALPHA 2 BIT</td></tr> <tr> <td>LV_IMG_CF_ALPHA_4_BIT</td> <td>ALPHA 4 BIT</td></tr> <tr> <td>LV_IMG_CF_ALPHA_8_BIT</td> <td>ALPHA 8 BIT</td></tr> <tr> <td>LV_IMG_CF_INDEXED_1_BIT</td> <td>INDEXED 1 BIT</td></tr> <tr> <td>LV_IMG_CF_INDEXED_2_BIT</td> <td>INDEXED 2 BIT</td></tr> <tr> <td>LV_IMG_CF_INDEXED_4_BIT</td> <td>INDEXED 4 BIT</td></tr> <tr> <td>LV_IMG_CF_INDEXED_8_BIT</td> <td>INDEXED 8 BIT</td></tr> <tr> <td>LV_IMG_CF_RAW</td> <td>RAW</td></tr> <tr> <td>LV_IMG_CF_RAW_CHROMA</td> <td>RAW CHROMA</td></tr> <tr> <td>LV_IMG_CF_RAW_ALPHA</td> <td>RAW ALPHA</td></tr> <tr> <td>LV_IMG_CF_TRUE_COLOR</td> <td>TRUE COLOR</td></tr> <tr> <td>LV_IMG_CF_TRUE_COLOR_ALPHA</td> <td>TRUE COLOR ALPHA</td></tr> <tr> <td>LV_IMG_CF_TRUE_COLOR_CHROMA_KEYED</td> <td>TRUE COLOR CHROMA</td></tr> <tr> <td>LV_IMG_CF_RGB565A8</td> <td>RGB565A8</td></tr> </tbody> </table>		<b>LVGL constant name</b>	<b>EEZ Studio value</b>	LV_IMG_CF_ALPHA_1_BIT	ALPHA 1 BIT	LV_IMG_CF_ALPHA_2_BIT	ALPHA 2 BIT	LV_IMG_CF_ALPHA_4_BIT	ALPHA 4 BIT	LV_IMG_CF_ALPHA_8_BIT	ALPHA 8 BIT	LV_IMG_CF_INDEXED_1_BIT	INDEXED 1 BIT	LV_IMG_CF_INDEXED_2_BIT	INDEXED 2 BIT	LV_IMG_CF_INDEXED_4_BIT	INDEXED 4 BIT	LV_IMG_CF_INDEXED_8_BIT	INDEXED 8 BIT	LV_IMG_CF_RAW	RAW	LV_IMG_CF_RAW_CHROMA	RAW CHROMA	LV_IMG_CF_RAW_ALPHA	RAW ALPHA	LV_IMG_CF_TRUE_COLOR	TRUE COLOR	LV_IMG_CF_TRUE_COLOR_ALPHA	TRUE COLOR ALPHA	LV_IMG_CF_TRUE_COLOR_CHROMA_KEYED	TRUE COLOR CHROMA	LV_IMG_CF_RGB565A8	RGB565A8
<b>LVGL constant name</b>	<b>EEZ Studio value</b>																																
LV_IMG_CF_ALPHA_1_BIT	ALPHA 1 BIT																																
LV_IMG_CF_ALPHA_2_BIT	ALPHA 2 BIT																																
LV_IMG_CF_ALPHA_4_BIT	ALPHA 4 BIT																																
LV_IMG_CF_ALPHA_8_BIT	ALPHA 8 BIT																																
LV_IMG_CF_INDEXED_1_BIT	INDEXED 1 BIT																																
LV_IMG_CF_INDEXED_2_BIT	INDEXED 2 BIT																																
LV_IMG_CF_INDEXED_4_BIT	INDEXED 4 BIT																																
LV_IMG_CF_INDEXED_8_BIT	INDEXED 8 BIT																																
LV_IMG_CF_RAW	RAW																																
LV_IMG_CF_RAW_CHROMA	RAW CHROMA																																
LV_IMG_CF_RAW_ALPHA	RAW ALPHA																																
LV_IMG_CF_TRUE_COLOR	TRUE COLOR																																
LV_IMG_CF_TRUE_COLOR_ALPHA	TRUE COLOR ALPHA																																
LV_IMG_CF_TRUE_COLOR_CHROMA_KEYED	TRUE COLOR CHROMA																																
LV_IMG_CF_RGB565A8	RGB565A8																																
<i>Export bitmap file</i>	Use to export embedded image.																																

### P10.3. Using a bitmap

Bitmap can be used in *Bitmap* widget (EEZ-GUI and Dashboard project), i.e. *Image* widget (LVGL project). It can also be used in *Style*.

Below is an example of using a bitmap in the *Bitmap* widget in the *Dashboard* project. Fig. 115 shows the added *Bitmap* widget (1) to the page. In the *Specific* section, we select which bitmap from the list of bitmaps we want to use (2), which in our example is the bitmap called *background* (3).

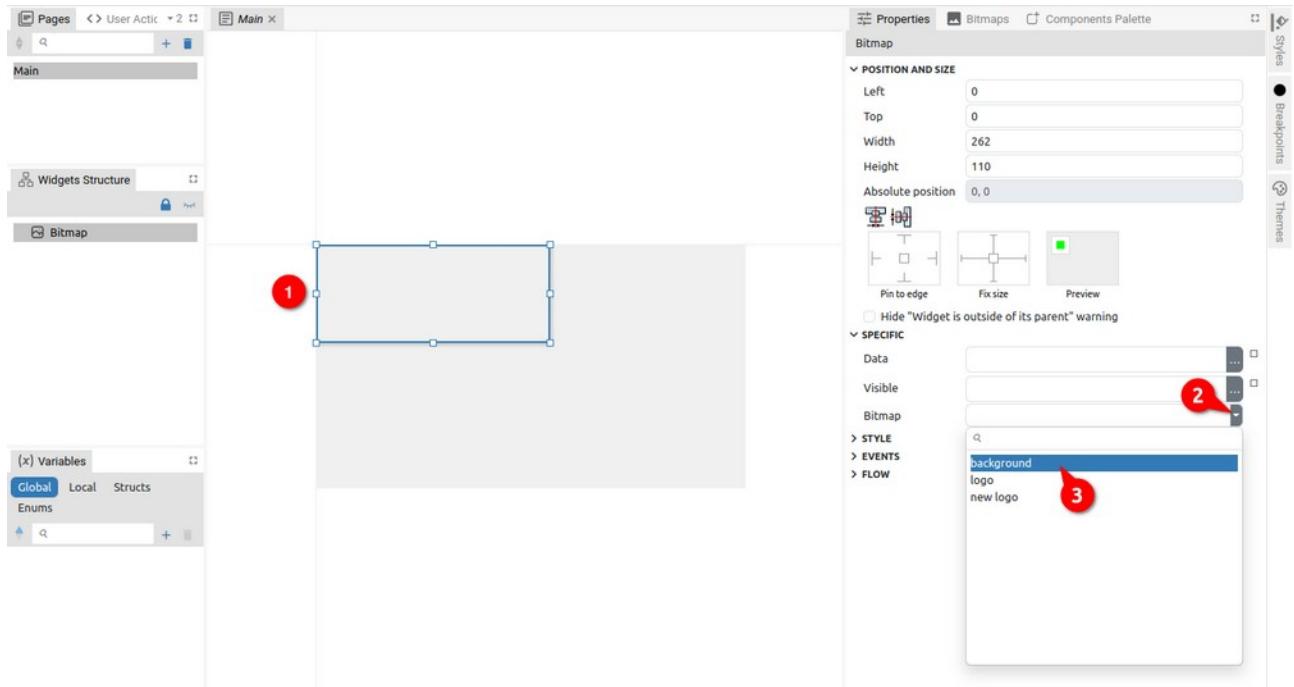

Fig. 115: Adding a bitmap to a Widget

Since the Widget's dimensions are smaller than the selected bitmap, the bitmap will exceed the Widget's borders as shown in Fig. 116. Here we can use the option *Resize to Fit Bitmap* (4) when the dimensions of the Widget will be adjusted to the size of the bitmap (Fig. 117).

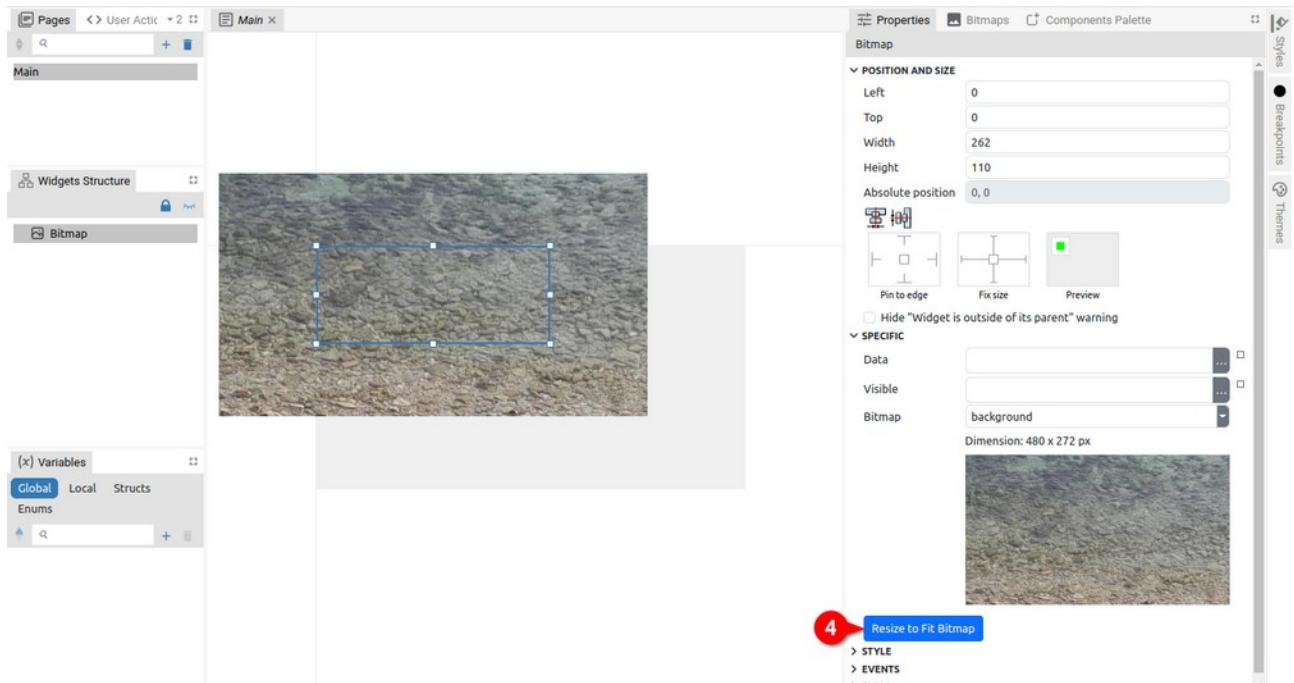

Fig. 116: Resizing the widget to fit the bitmap

Please note that this option is visible only if the current dimensions of the Widget do not match the dimensions of the bitmap (Fig. 117).

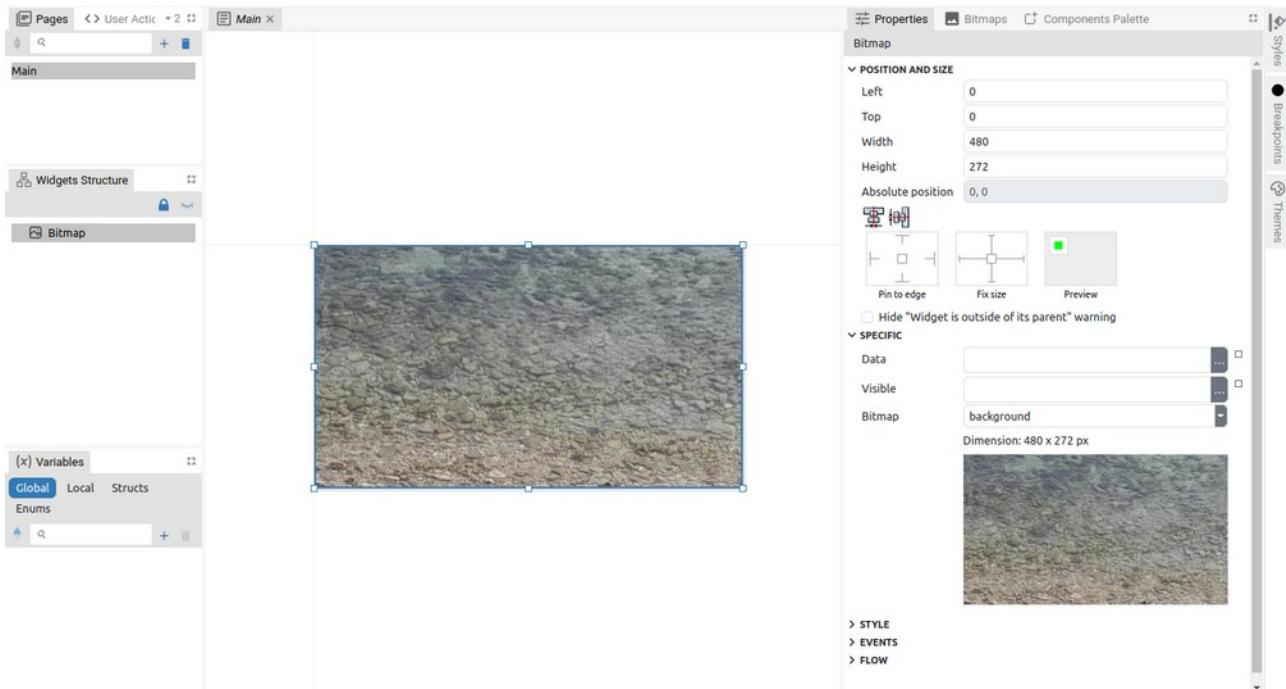

Fig. 117: Widget resized to bitmap size

## P11. Fonts

The EEZ Studio project supports working with fonts. To work with fonts, it will be necessary in the project Settings (Fig. 118) under the *General* section (1) to enable the *Fonts* option in the project Settings (2).

The *Font* used consists of one or more characters taken from a TTF or OTF file and converted to anti-aliased bitmaps.

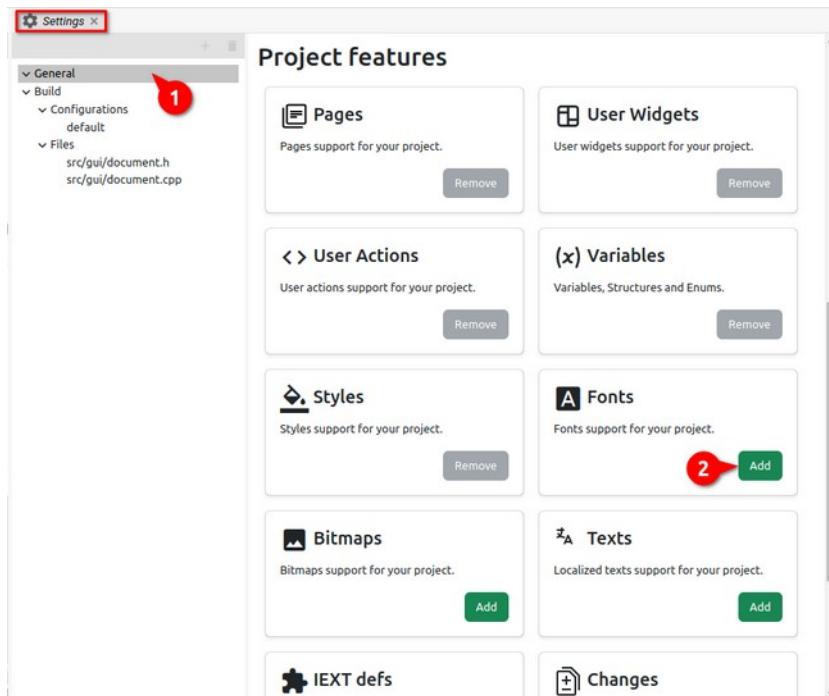

Fig. 118: Enable Fonts in project Settings

Fonts are defined only for *EEZ-GUI* and *LVGL* projects, and *Dashboard* projects do not use fonts. In the *Dashboard* project, vector fonts are used and the font is selected according to the name (*Font Family* attribute in *Style*).

In the *EEZ-GUI* project we have more options for editing fonts than in the *LVGL* project. Therefore, we will describe the work with fonts in those two types of projects in separate subsections.

### P11.1. EEZ-GUI project fonts

#### P11.1.1. Add new font

To add a new font, it is necessary to select the *Add item* option in the *Fonts* panel, when the dialog shown in Fig. 119.

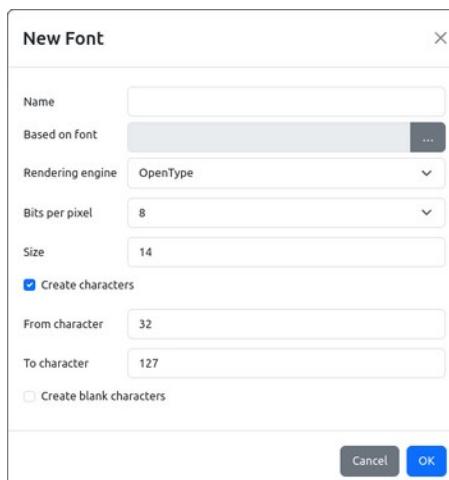

Fig. 119: Adding a new font to the EEZ-GUI project

Item	Description
<i>Name</i>	The name of the font to be used in the project.
<i>Font file</i>	Selection of font file from local storage.
<i>Rendering engine</i>	The rendering engine, which can be FreeType ( <a href="https://freetype.org/">https://freetype.org/</a> ) or OpenType ( <a href="https://opentype.js.org/">https://opentype.js.org/</a> ), converts from vector to bitmap format.
<i>Font size (points)</i>	Size is in points (pt). Use this formula to convert points to pixels: 1 pt = 1.333 px.
<i>Create characters</i>	If unchecked, not a single character will be created when adding a font, i.e. characters can be added later. If it is checked, then the range of characters to be created will need to be selected, and then <i>Create blank characters</i> can be used if we want all characters to be empty. These options are rarely used, and can be used to create icon fonts.
<i>From character</i>	Decimal number of the initial character we want to create (e.g. 32 = 0x20 = blank space).
<i>To character</i>	Decimal number of the final character we want to create.
<i>Create blank characters</i>	If it is enabled, all added characters will be empty.

After the font has been successfully added and the desired characters have been created, it is possible to view them in the table as shown in Fig. 120 For the selected character, its enlarged preview will be displayed on the right.

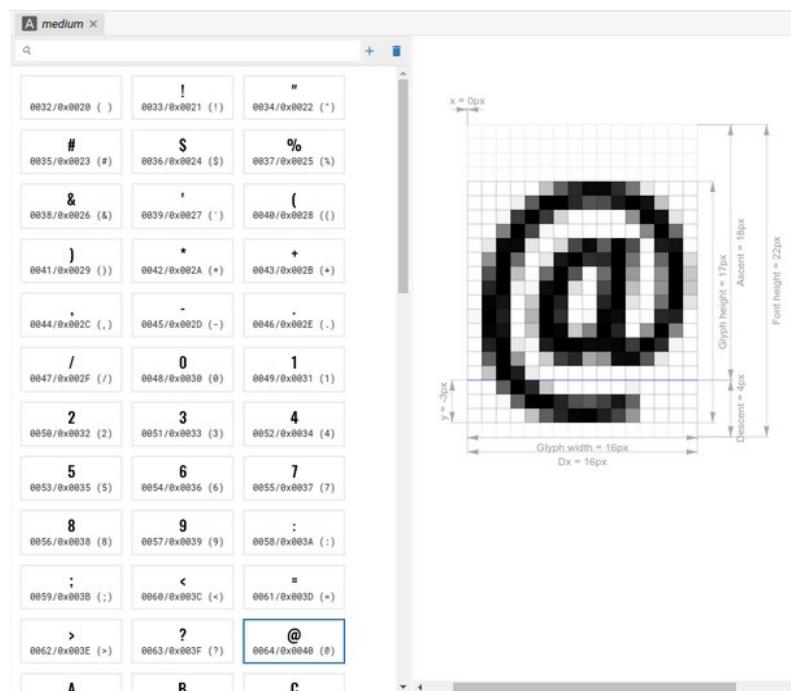

Fig. 120: Font character table (EEZ-GUI project)

### P11.1.2. Add character

Once we have added the font to the project, it is possible to add new characters or delete existing ones. For this, we use the options shown in Fig. 121.

Fig. 121: Add/delete font character

When adding a new character, a dialog opens as shown in Fig. 122.

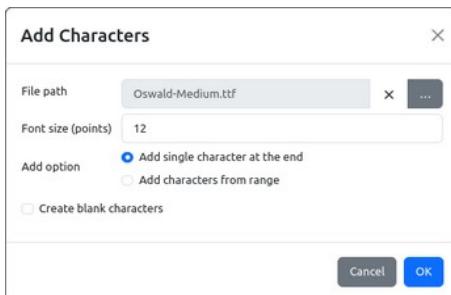

Fig. 122: Add new font character

Item	Description
<i>File path</i>	File path to the font file on local storage. An existing one can be deleted or a new one can be added.
<i>Font size (points)</i>	Size is in points (pt). Use this formula to convert points to pixels: 1 pt = 1.333 px.
<i>Add option</i>	
<i>Add single character at the end</i>	Adding only one character to the end of the table.
<i>Add characters from range</i>	Adding two or more characters from a defined range.
<i>Add missing characters</i>	The option is available only if multi-language is used ( <i>Texts</i> panel, see Chapter P12) and there is a character in one of the strings that is not present in the font.
<i>Create blank characters</i>	If it is enabled, all added characters will be empty.

## P11.2. LVGL project fonts

### P11.2.1. Add new font

To work with fonts in the *LVGL* project, the library [https://github.com/lvgl/lv\\_font\\_conv](https://github.com/lvgl/lv_font_conv) is used. To add a new font, it is necessary to select the *Add item* option in the *Fonts* panel, when the dialog shown in Fig. 123.

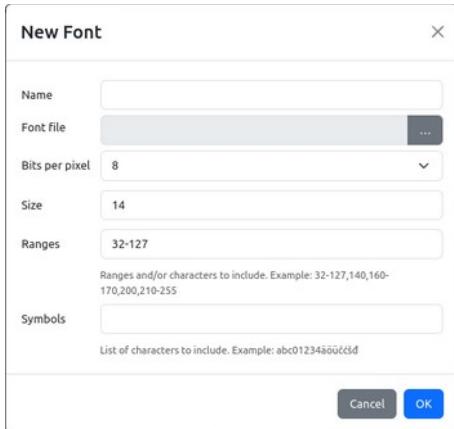

Fig. 123: Adding a new font to the LVGL project

Item	Description
Name	The name of the font to be used in the project.
Font file	Selection of font file from local storage.
Bits per pixel	1, 2, 4, or 8-bits. Defines the number of shades to be used for anti-aliasing. The higher the number, the softer the characters will look, but the font will also use more storage memory.
Font size (pixels)	Size in pixels (px).
Ranges	Defines ranges and/or characters to include.
Symbols	List of characters to include.

In Fig. 124 shows the properties of the selected font, and Fig. 9 properties of the selected character from the font table. All properties are informative in nature, i.e. cannot be changed, except that the Description for the Font can be edited.

Fig. 124: Font properties

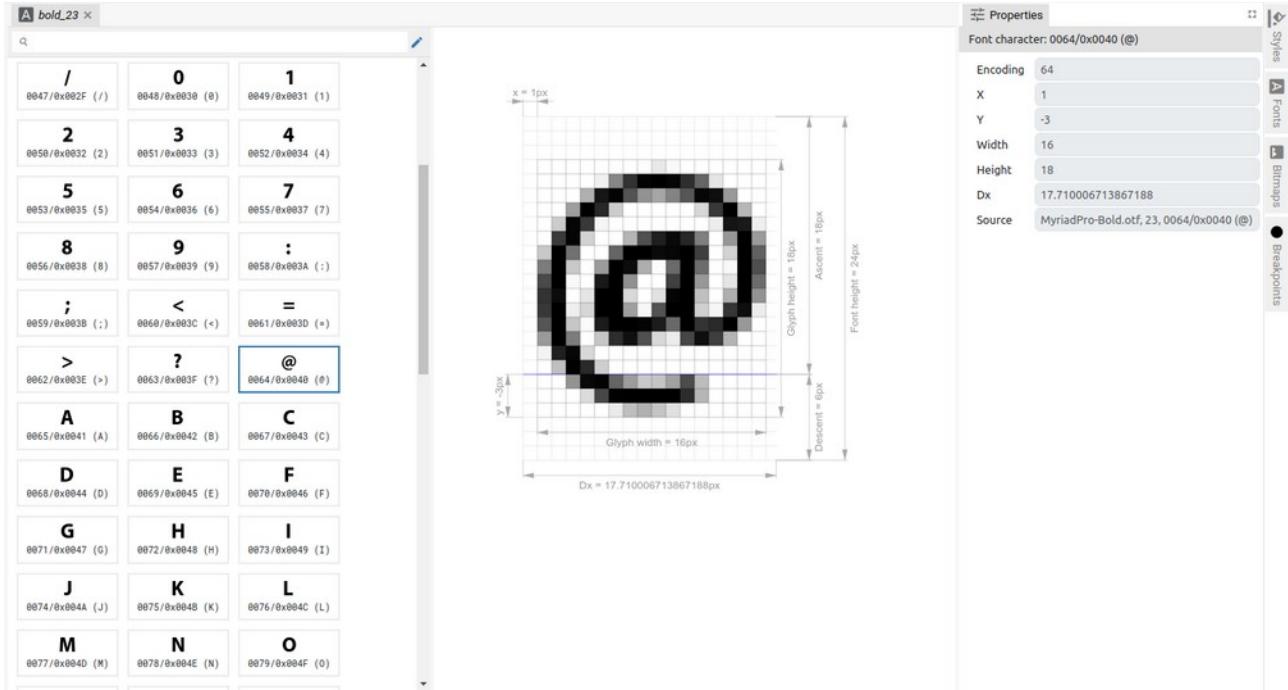

Fig. 125: Font character table (LVGL project)

### P11.2.2. Edit characters

Once the font is created, the only thing we can do with the font in terms of editing is to add or delete characters. For this, it is necessary to select the *Add or Remove Characters* option shown in Fig. 126.

Fig. 126: Add or Remove characters option (LVGL project)

The dialog shown in Fig. 127 through which it is possible to define the Ranges and/or Symbols of the character we want to have in the font table.

Fig. 127: Font characters editing (LVGL project)

## P12. Texts

Projects that support multi-language texts can be found in *New Project Examples* (Fig. 128) and can serve as a starting point for a project that requires the use of multiple languages.

*Multi-language is currently supported only in EEZ-GUI and Dashboard projects.*

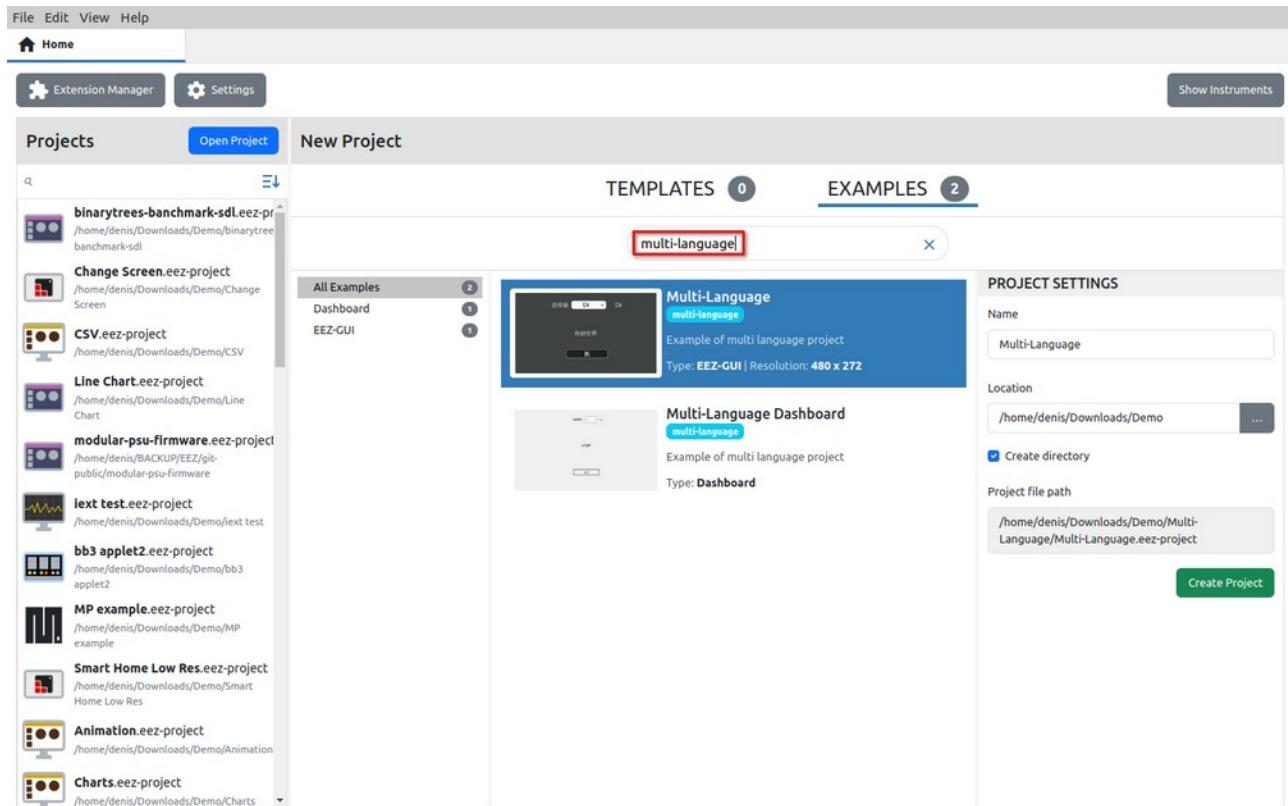

Fig. 128: Multi-language project examples

### P12.1. Texts panel

Fig. 129 shows the *Texts* panel for multilingual text editing, which consists of the following three tabs: *Text resources* (1), *Languages* (2) and *Statistics* (3).

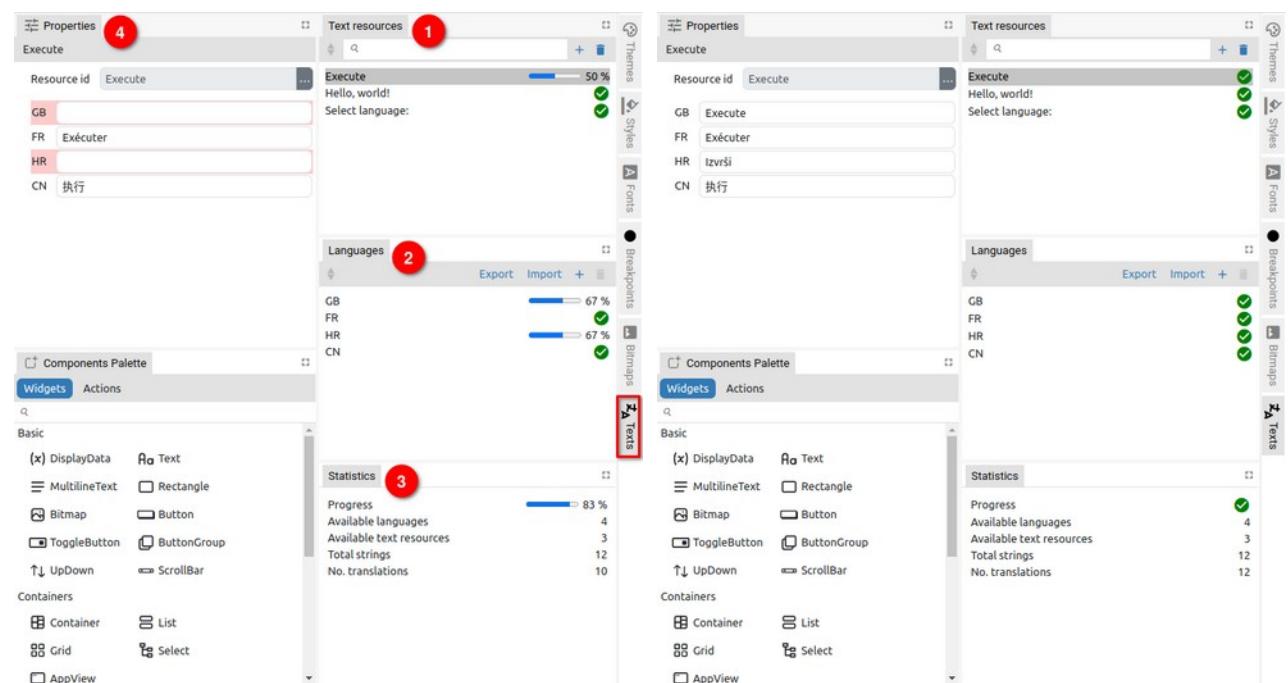

Fig. 129: Editing Texts resources

Fig. 130: Completed multi-language translation

*Text resources* contains a list of IDs of all texts that are multilingual. For each *Resource ID* there should be a translation for all defined *Languages*.

The content of the texts for all defined languages can be seen in *Properties* (4).

There is no limit to the number of languages and text resources in the project. When adding a new *Language*, a dialog will open as shown in Fig. 131, and for adding a new multilingual *Text resource*, a dialog opens as shown in Fig. 132.

Fig. 131: Add new Language

Fig. 132: Add new Text resource

The completeness of the translation can be easily checked thanks to the progress bars for each *Resource ID* and *Language*. The overall translation statistics are displayed in the *Statistics* tab (3). Fig. 130 shows an example when all texts are translated.

The *SelectLanguage* action is used at runtime to select the active language.

There are two methods for using localized text in expressions:

- Using the special literal `T"<text resource ID>"`. For example `T"Hello, world!"` where "Hello, world!" one of the IDs in the *Text Resources* tab.
- Using the function `Flow.translate("<text resource ID>")`. For example, `Flow.translate("Hello, world!")`

Since it is simpler, it is recommended to use the first method.

If there is currently no translation for a language, then the text resource ID itself will be used, so it is convenient for that ID to be the same as the translation for one of the languages, for example in English.

## P12.2. XLIFF Import/export

XLIFF (XML Localization Interchange File Format) is an XML-based format created to standardize the way localizable data are passed between and among tools during a localization process and a common format for CAT (Computer-Aided Translation) tool exchange.

By using this format, it is possible for a professional translator to prepare translations in the tool with which he/she is familiar and deliver the translations to the developer, who will insert them into the EEZ Studio project.

Options for Import and Export text resources in XLIFF format can be found in the *Language* panel.

Fig. 133: Text import from XLIFF file

Fig. 134: Text export to XLIFF file

During import, a dialog opens as shown in Fig. 133 where you have to select the *File path* to XLIFF file

and the *Language* into which the text strings will be imported (combo box with a list of all defined languages).

When exporting (Fig. 134), the *Source language* and *Target language* should be defined, as well as the *XLIFF file format version* (1.2 or 2.0 depending on what the translation tool supports). In Fig. 135 shows the exported XLIFF file in the *Poedit* application (*Source language* is GB, *Target language* is FR).

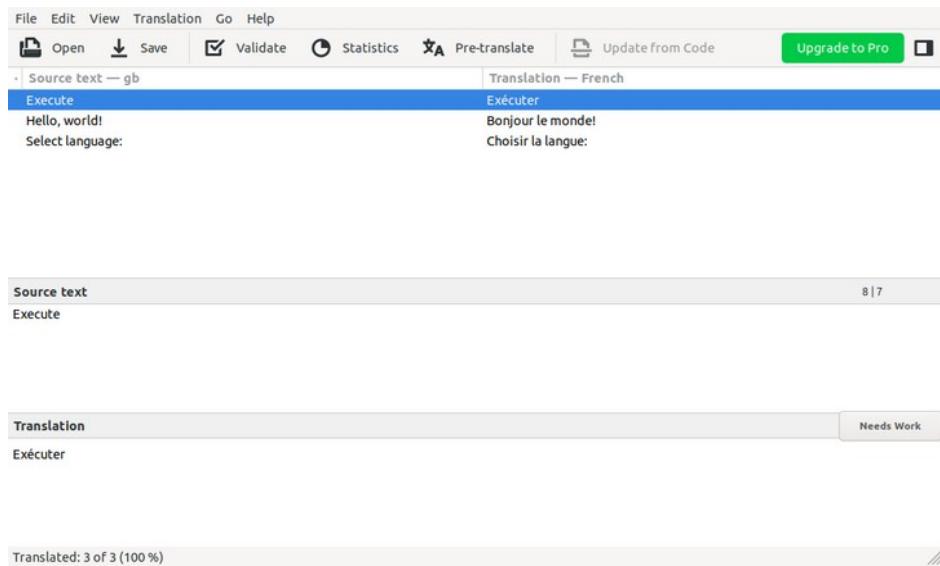

Fig. 135: Exported XLIFF file opened in Poedit

## P13. Settings

Project Settings is used to configure the project and the number of parameters and features depends on the project type. Examples of Settings page for *EEZ-GUI* project is shown in Fig. 136.

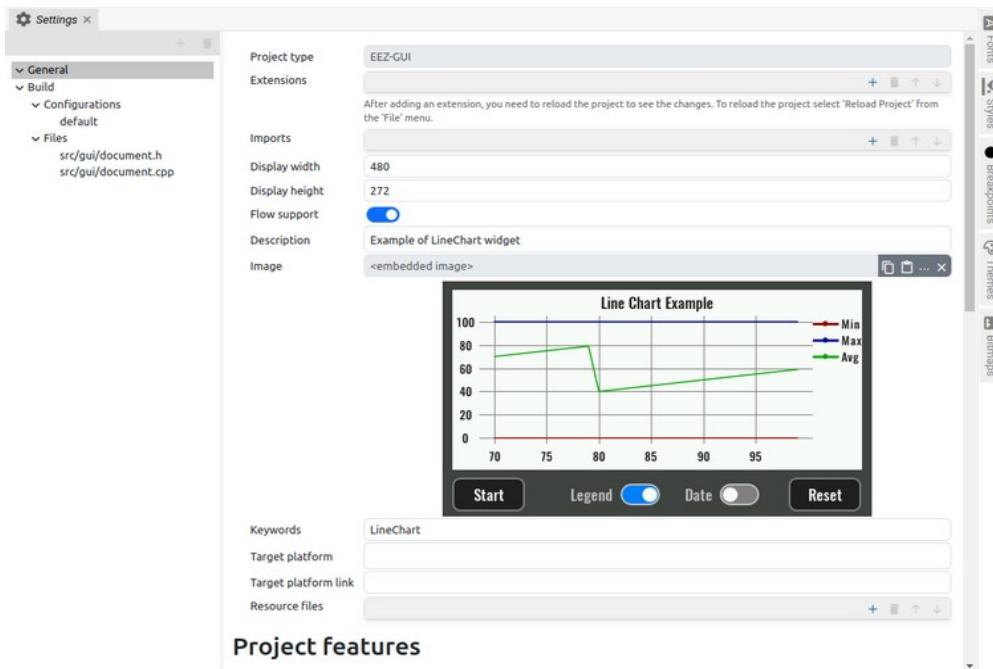

Fig. 136: General Project settings (*EEZ-GUI*)

### P13.1. General

Item	Description
<i>Project type</i>	Information about the project type. It is generated when creating a new project and cannot be changed later. Supported project types: <i>Dashboard</i> , <i>EEZ-GUI</i> , <i>LVGL</i> , <i>BB3 MicroPython Script</i> and <i>BB3 Applet</i> (for descriptions see Section P1.1).
<i>Target BB3 firmware (BB3 MicroPython Script only)</i>	Supported versions: <i>1.7.X or older</i> or <i>1.8 or newer</i>
<i>Master project (BB3 Applet and BB3 MicroPython Script only)</i>	This is populated when creating a project with the BB3 firmware project name i.e. <i>modular-psu-firmware.eez-project</i> . It can be replaced with a different name and location if needed.
<i>Extensions</i>	List of extensions used by the project. Extensions can be added, deleted and moved in the order in which they will be loaded (Note that the order of loading is not crucial for code execution).
<i>Import</i>	List of external projects used by the project. <b>More info is needed XX.</b>
<i>Title (Dashboard only)</i>	The name of the standalone application or instrument dashboard.
<i>Icon (Dashboard only)</i>	Icon for standalone applications or instrument dashboard.
<i>Display width (EEZ-GUI and LVGL only)</i>	Page width in pixels.
<i>Display height (EEZ-GUI and LVGL only)</i>	Page height in pixels.
<i>Flow support (EEZ-GUI and LVGL only)</i>	Enable the use of EEZ Flow in the project.
<i>Description</i>	Project description shown in the <i>New Project Examples</i> section.
<i>Image</i>	Project screenshot shown in the <i>New Project Examples</i> section.
<i>Keywords</i>	Project keywords shown in the <i>New Project Examples</i> section.

<i>Target platform</i>	Project target platform shown in the <i>New Project Examples</i> section.
<i>Target platform link</i>	Link to the website of the target platform shown in the New Project Examples section.
<i>Resource files</i>	List of external files used by Examples. It can be e.g., a <code>.py</code> file used by the Python example ( <i>Charts</i> project), or a <code>.csv</code> file used by the CSV example ( <i>CSVProject</i> ), etc.
<i>Project features</i>	The number of Features depends on the project type. In Fig. 137 are shown for the EEZ-GUI project.

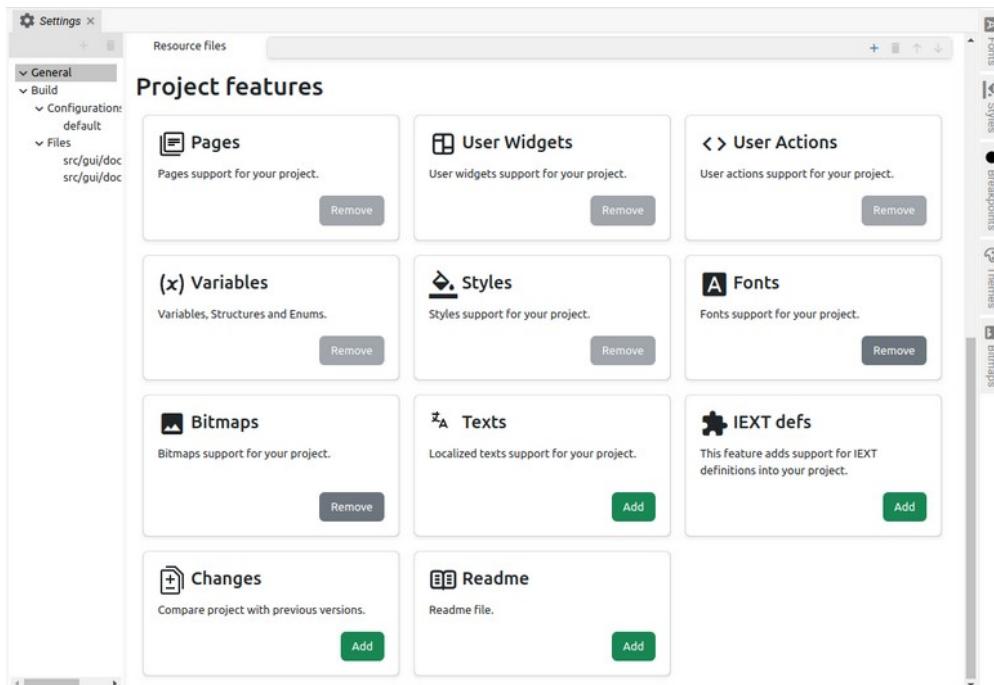

Fig. 137: Project features (EEZ-GUI)

## P13.2. Build

The *Build* subsection is only available for *EEZ-GUI* and *LVGL* projects.

Item	Description
<i>Destination folder</i>	The folder in which the build files will be inserted.
<i>LVGL include (LVGL only)</i>	Path to the <code>lvgl.h</code> header file. Normally it is <code>lvgl/lvgl.h</code> , but if it is located somewhere else then it can be specified there.

### P13.2.1. Configurations

The *Configurations* subsection is only available for *EEZ-GUI* projects.

A project can define multiple build configurations. For example, if we use the same project to build native firmware for the hardware board and for the simulator and we do not want to include in the build files for the hardware board resources that are used only for the simulator and vice versa, we will define two configurations.

For *Page*, *Action*, *SCPI command*, *Shortcut* and *Variable*, we can indicate in which configuration they are used.

The *Used in* property (Fig. 138) is used to define in which configuration the item will be used.

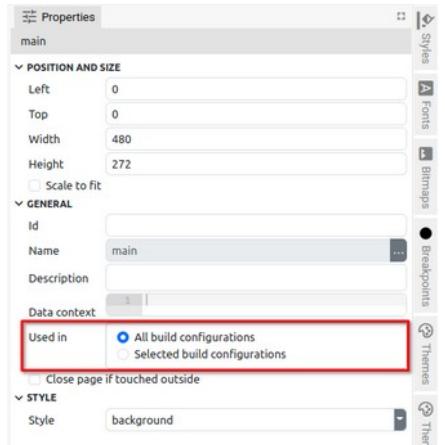

Fig. 138: EEZ-GUI project Used in parameter

Build Configuration parameters are shown in Fig. 139.

Fig. 139: EEZ-GUI build configuration settings

Item	Description
Name	The name of the build configuration.
Description	Description of the build configuration.
Properties	They are used for IEXT to specify additional IEXT options and are defined in JSON format. In the IEXT definition, it is indicated which configuration is used, which is described in Chapter XX.

### P13.2.2. Files

The *Files* subsection is only available for *EEZ-GUI* and *LVGL* projects. List of template source files from which source files will be generated. This is all already prepared during the creation of the project from the wizard.

*EEZ Studio*  
*Actions*

## A1. AddToInstrumentHistory

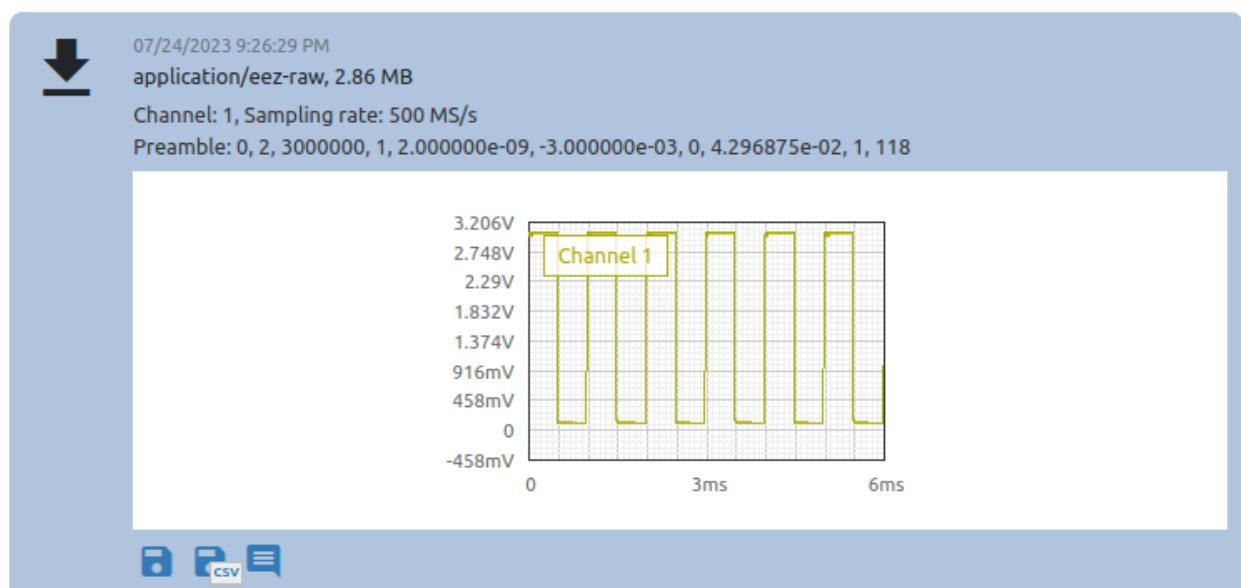

### A1.1. Description

It is used to add a new item to the *History* view of the instrument. Currently, only adding chart items is supported.

For example in the *Rigol Waveform Data* example we have this Action:

It is used to add a chart which, after successful addition, will be displayed as follows (example of test signal acquisition):

## A1.2. Properties

### Specific

#### A1.2.1. Instrument *EXPRESSION (object:Instrument)*

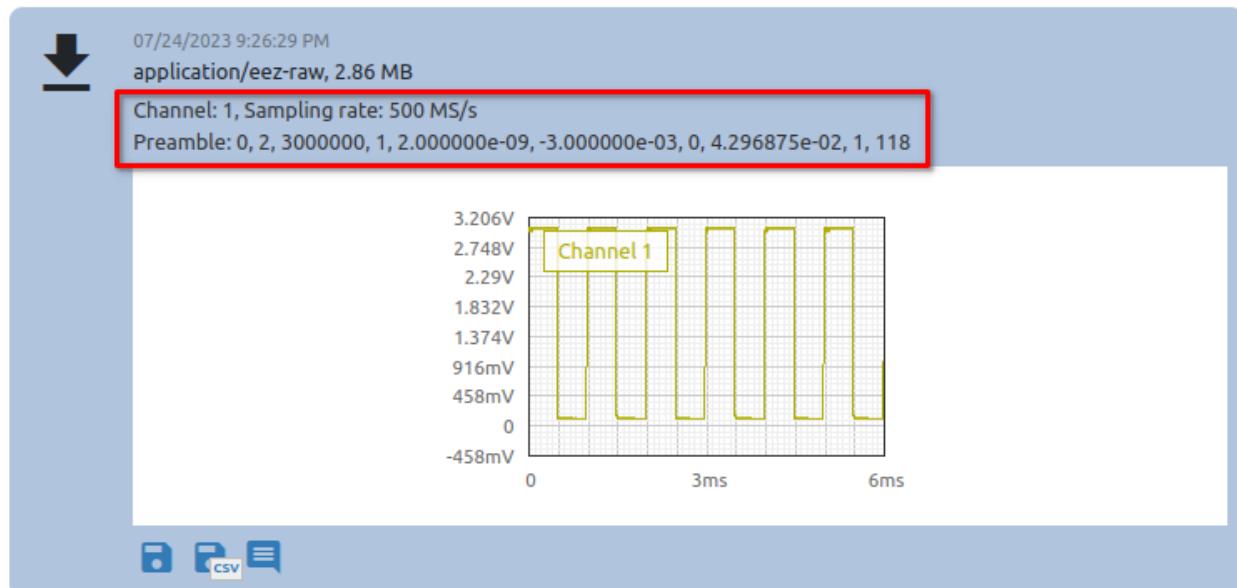

An instrument in whose *History* an item will be added.

#### A1.2.2. Item type *Enum*

Item type to be added, currently it can only be "Chart".

#### A1.2.3. Chart description *EXPRESSION (string)*

Description of the chart displayed in the instrument *History*:

#### A1.2.4. Chart data *EXPRESSION (blob)*

A string or blob containing the samples that will be displayed in the chart.

#### A1.2.5. Chart sampling rate *EXPRESSION (float)*

Sampling rate or number of samples per second (SPS).

#### A1.2.6. Chart offset *EXPRESSION (double)*

Offset value used in formula `offset + sample_value * scale` which transforms sample value to sample position on y axis in the chart.

#### A1.2.7. Chart scale *EXPRESSION (double)*

When displaying samples, the formula `offset + sample_value * scale` is used.

#### A1.2.8. Chart format *EXPRESSION (string)*

Format from `Chart data`. Possible values:

- "float" – "Chart data" must be a blob containing 32-bit, little-endian float numbers.
- "double" – "Chart data" must be a blob containing 64-bit, little-endian float numbers.
- "rigol-byte" – "Chart data" must be a blob containing 8-bit unsigned integer numbers.
- "rigol-word" – "Chart data" must be a blob containing 16-bit unsigned integer numbers.

- "csv" – "Chart data" must be a CSV string, the first column is taken.

**A1.2.9. Chart unit** *EXPRESSION (integer)*

The unit displayed on the Y-axis. The X-axis is always time.

**A1.2.10. Chart color** *EXPRESSION (string)*

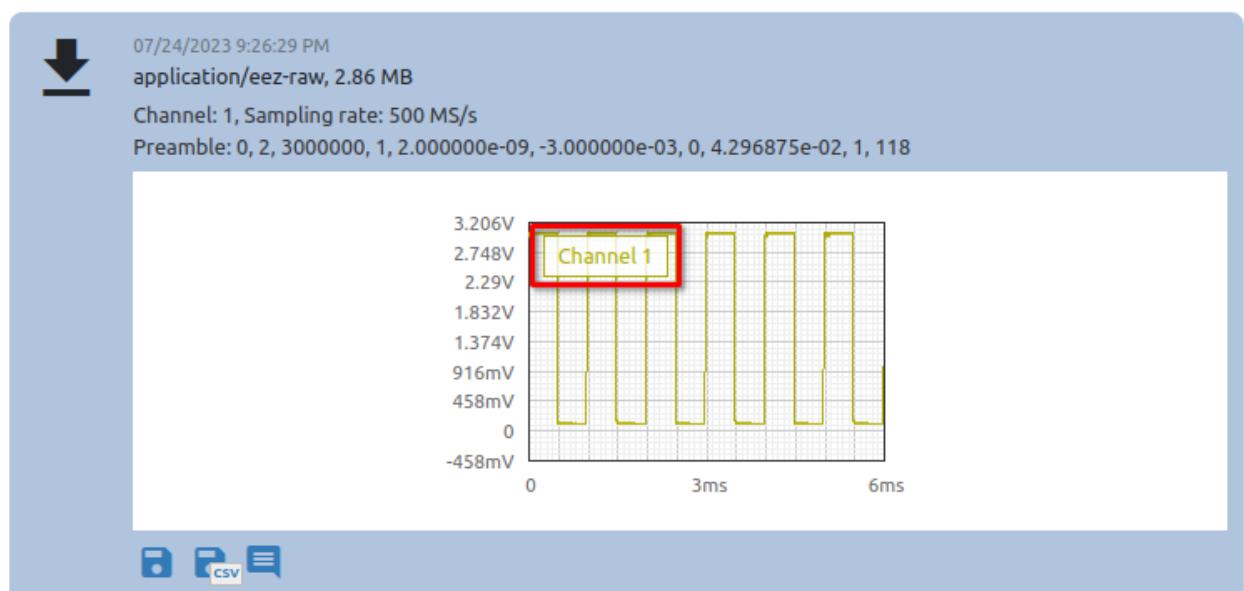

The color of the line in the chart if a dark background is selected.

**A1.2.11. Chart color inverse** *EXPRESSION (string)*

The color of the line in the chart if the light background is selected.

**A1.2.12. Chart label** *EXPRESSION (string)*

Chart label:

**A1.2.13. Chart major subdivision horizontal** *EXPRESSION (integer)*

**View Options**   Rulers   Help

Axes lines subdivision:

Dynamic

Fixed

X axis	Y axis
Major	12
Minor	5

Snap to grid

**A1.2.14. Chart major subdivision vertical** *EXPRESSION (integer)*

Axes lines subdivision:

Dynamic

Fixed

	X axis	Y axis
Major	12	by 8
Minor	5	by 5

Snap to grid

#### A1.2.15. Chart minor subdivision horizontal *EXPRESSION (integer)*

Axes lines subdivision:

Dynamic

Fixed

	X axis	Y axis
Major	12	by 8
Minor	5	by 5

Snap to grid

#### A1.2.16. Chart minor subdivision vertical *EXPRESSION (integer)*

Axes lines subdivision:

Dynamic

Fixed

	X axis	Y axis
Major	12	by 8
Minor	5	by 5

Snap to grid

#### A1.2.17. Chart horizontal scale *EXPRESSION (double)*

The number that defines the X-axis zoom factor in the default chart view.

#### A1.2.18. Chart vertical scale *EXPRESSION (double)*

The number that defines the Y-axis zoom factor in the default chart view.

## General

**A1.2.19. Description** *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

**Flow****A1.2.20. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

**A1.2.21. Outputs** *Array*

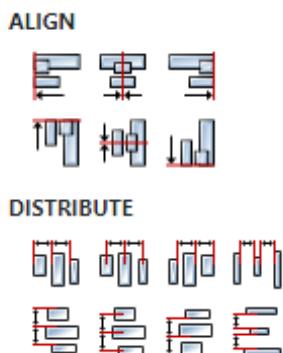

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**A1.2.22. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**Position and size****A1.2.23. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**A1.3. Inputs****A1.3.1. seqin** *SEQ / MANDATORY*

A standard sequence input.

## A1.4. Outputs

### A1.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A1.4.2. id DATA(string) / OPTIONAL

ID of the added history item. We can, for example, use this data in the `Chart` Widget to display the chart history item inside the dashboard.

## A1.5. Examples

- *Rigol Waveform Data*

## A2. Animate

### A2.1. Description

If this action is used inside Page or User Widget, it will move the position of the animation timeline from one position (`From` property) to another (`To` property) with given speed (`Speed` property).

If we want to instantly jump to a certain position (`To` property), then we should set the Speed to `0` - in that case the `From` property value doesn't matter (it can be set to the same value as `To` property).

The expression `Flow.pageTimelinePosition()` can be used for the `From` property and in that case the animation will start from the current position.

### A2.2. Properties

#### Specific

##### A2.2.1. From *EXPRESSION (float)*

Start position set in seconds.

##### A2.2.2. To *EXPRESSION (float)*

End position set in seconds.

##### A2.2.3. Speed *EXPRESSION (float)*

Determines the duration of the animation. If set to `1` then the animation will last `From - To` seconds. If we want a twice as fast animation then it should be set to `2`, and if we want a twice slower animation then it should be set to `0.5`.

If we want the animation to last a specific time `T` then the formula  $T / (From - To)$  can be used, e.g. if `T` is equal to `0.5` seconds, From `1` seconds and To `3` seconds, then `0.5 / (3 - 1)` should be set for speed, i.e. `0.25`.

If it is set to `0` then it will immediately jump to the `To` position during execution.

#### General

##### A2.2.4. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A2.2.5. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A2.2.6. Outputs *Array*

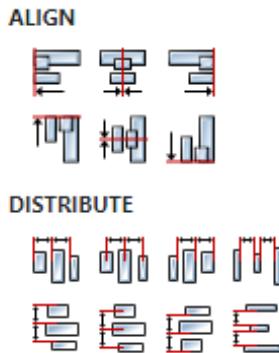

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**A2.2.7. Catch error Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**Position and size****A2.2.8. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**A2.3. Inputs****A2.3.1. seqin SEQ / OPTIONAL**

A standard sequence input.

**A2.4. Outputs****A2.4.1. seqout SEQ / OPTIONAL**

A standard sequence output. It is activated when the animation is finished, ie. when the `To` position was reached.

**A2.5. Examples**

- *Animation*
- *sld-eez-flow-demo*

## A3. CatchError

### A3.1. Description

This Action catches all errors that occurred within the Flow in which it is located, or within any of the Child flows that were created by its execution (for example, a Child flow is created when a User action is called).

### A3.2. Properties

#### General

##### A3.2.1. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A3.2.2. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A3.2.3. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

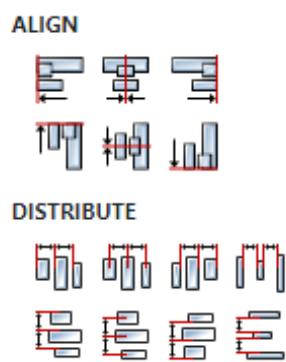

##### A3.2.4. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A3.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A3.3. Outputs

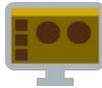

#### A3.3.1. seqout *SEQ / OPTIONAL*

A standard sequence output.

#### A3.3.2. Message *DATA(string) / MANDATORY*

The output through which the description of the caught error is sent.

## A4. ClipboardWrite

### A4.1. Description

Writes data specified through the `data` property to the clipboard, which can be text or image.

### A4.2. Properties

#### Specific

##### A4.2.1. Data *EXPRESSION (any)*

Data that is written to the clipboard. It can be of type `string` or `blob`. If it is of type 'blob', then it is assumed that it is an image.

#### General

##### A4.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A4.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A4.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

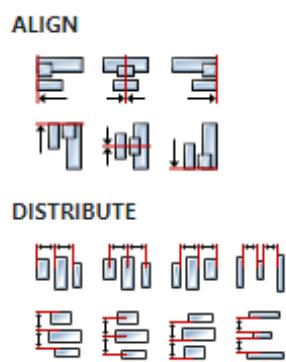

##### A4.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A4.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A4.3. Inputs

#### A4.3.1. seqin SEQ / OPTIONAL

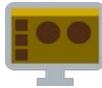

A standard sequence input.

### A4.4. Outputs

#### A4.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A5. CollectStream

### A5.1. Description

Concatenates a stream into a string. As data from the stream comes in chunks, they are concatenated into a string and sent to the data output. During the stream lifetime, this Action can repeatedly send the currently collected string through `data`. Flow execution continues through the `seqout` output when the stream is closed.

### A5.2. Properties

#### Specific

##### A5.2.1. Stream *EXPRESSION (any)*

A stream whose content will be concatenated into a string.

#### General

##### A5.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A5.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A5.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

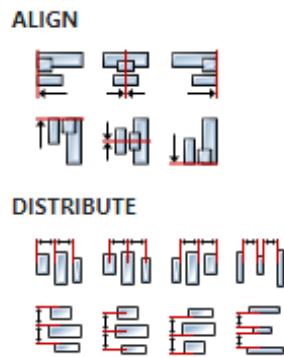

##### A5.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A5.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A5.3. Inputs

#### A5.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A5.4. Outputs

#### A5.4.1. seqout SEQ / OPTIONAL

A standard sequence output. Flow execution continues through this output after the stream is closed.

#### A5.4.2. data DATA(string) / MANDATORY

The concatenated string is sent through this output. During the stream lifetime, a string can be sent several times, which will contain all the data collected until then (i.e. the string will grow over time as new data arrives).

### A5.5. Examples

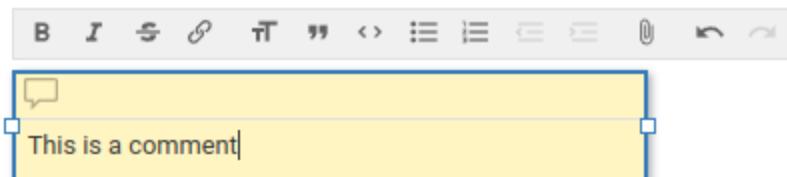

- *RegEx Stream*

## A6. Comment

### A6.1. Description

This Action has no effect on the Flow execution, but only serves to add comments to the Flow.

## A7. Compare

### A7.1. Description

Compares expressions depending on the operator and if the result is `true` Flow execution continues through `True` output, otherwise `False` output is used.

### A7.2. Properties

#### Specific

##### A7.2.1. A *EXPRESSION (any)*

Expression on the left side of the comparison.

##### A7.2.2. B *EXPRESSION (any)*

Expression on the right side of the comparison. It is not used if the operator is `NOT`.

##### A7.2.3. C *EXPRESSION (any)*

This expression is used only in the case of the `BETWEEN` operator, then it is checked whether `A >= B` and `A <= C`.

##### A7.2.4. Operator *Enum*

It is possible to use one of the following operators:

- `=` – A is equal to B, i.e. `A == B`
- `<` – A is less than B, i.e. `A < B`
- `>` – A is greater than B, i.e. `A > B`
- `<=` – A is less or equal to B, i.e. `A <= B`
- `>=` – A is greater or equal to B, i.e. `A >= B`
- `<>` – A is different then B, i.e. `A != B`
- `NOT` – A is not true, i.e. `!A`
- `AND` – both A and B are true, i.e. `A && B`
- `OR` – either A or B is true, i.e. `A || B`
- `XOR` – either A or B is true, but not both, `A ^ B`
- `BETWEEN` – A is between B and C, i.e. A is greater then or equal to B and A is less then or equal to C, i.e. `A >= B AND A <= C`

#### General

##### A7.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A7.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### A7.2.7. Outputs    Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

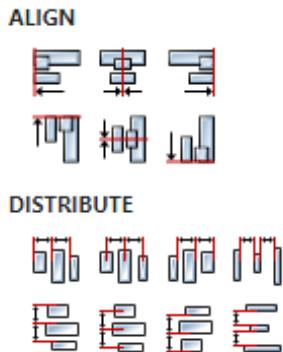

### A7.2.8. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A7.2.9. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A7.3. Inputs

### A7.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

## A7.4. Outputs

### A7.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

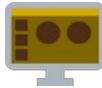

### A7.4.2. True    SEQ / OPTIONAL

Output that will be used to continue execution of the Flow if the value of the expression is `true`.

### A7.4.3. False    SEQ / OPTIONAL

Output that will be used to continue execution of the Flow if the value of the expression is `false`.

## A8. ConnectInstrument

### A8.1. Description

Initiates asynchronous connection to the instrument, i.e. the Action will not wait for us to disconnect from the instrument before exiting to `seqout`, but exits immediately. We can check whether we are connected or not with `instrument_variable.isConnected`. For example we can monitor this expression within the *Watch* Action in order to catch the moment when connection to the instrument occurred to start sending SCPI commands.

### A8.2. Properties

#### Specific

##### A8.2.1. Instrument *EXPRESSION (object:Instrument)*

Instrument object to connect to.

#### General

##### A8.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A8.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A8.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

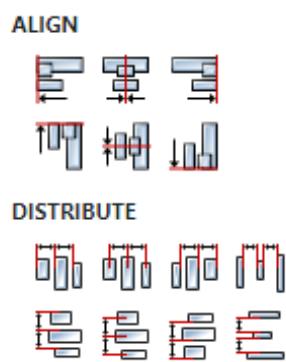

##### A8.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A8.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A8.3. Inputs

#### A8.3.1. seqin SEQ / MANDATORY

A standard sequence input.

### A8.4. Outputs

#### A8.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A9. Constant

### A9.1. Description

Passes the set constant through the `value` data output.

### A9.2. Properties

#### Specific

##### A9.2.1. Value    *EXPRESSION (string)*

Expression whose result is sent to `value` output. This expression must not use variables. Some examples:

- `"string"`
- `42`
- `3.14159265`
- `true`
- `Math.sin(0.5)`

#### General

##### A9.2.2. Description    *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A9.2.3. Inputs    *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A9.2.4. Outputs    *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A9.2.5. Catch error    *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

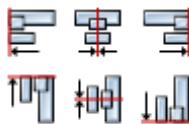

#### Position and size

##### A9.2.6. Align and distribute    *Any*

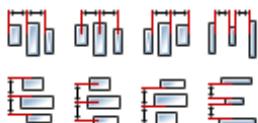

Alignment icons and component distribution. Alignment icons appear when two or more compo-

nents are selected, and distribution icons appear when three or more components are selected.

**ALIGN**

**DISTRIBUTE**

### A9.3. Inputs

#### A9.3.1. seqin    *SEQ / OPTIONAL*

A standard sequence input.

### A9.4. Outputs

#### A9.4.1. seqout    *SEQ / OPTIONAL*

A standard sequence output.

#### A9.4.2. value    *DATA(any) / MANDATORY*

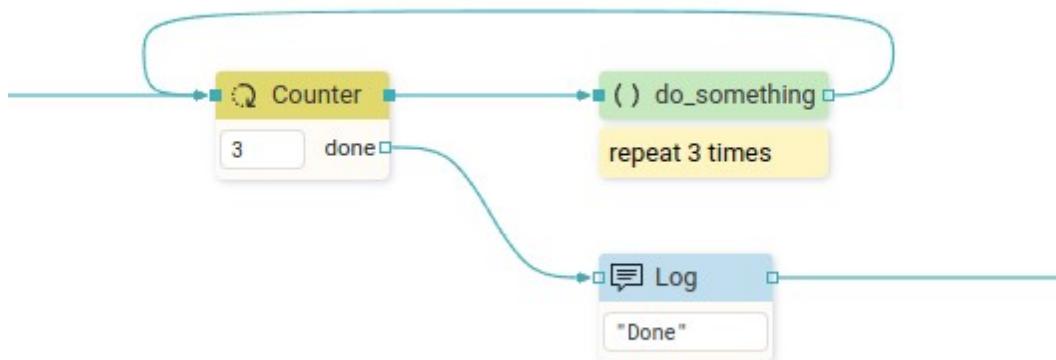

Data output through which the set constant is passed.

## A10. Counter

### A10.1. Description

Used to execute a specific part of the Flow a given number of times.

### A10.2. Properties

#### Specific

##### A10.2.1. Count value *EXPRESSION (integer)*

Expression that defines the number of repetitions in the loop.

#### General

##### A10.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

**A10.2.3. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

**A10.2.4. Outputs** *Array*

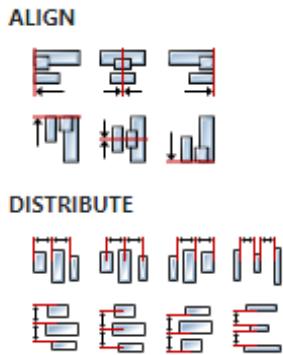

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**A10.2.5. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**Position and size****A10.2.6. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**A10.3. Inputs****A10.3.1. seqin** *SEQ / MANDATORY*

A standard sequence input.

**A10.4. Outputs****A10.4.1. seqout** *SEQ / MANDATORY*

Flow execution continues through this output until the given number of repetitions has been completed.

**A10.4.2. done** *SEQ / OPTIONAL*

Flow execution continues through this output when the given number of repetitions has been completed.

## A11. CSVParse

### A11.1. Description

Parses a CSV string, constructs a value of the set type and sends it through the `result` output.

### A11.2. Properties

#### Specific

##### A11.2.1. Input *EXPRESSION (string)*

CSV string to be parsed.

##### A11.2.2. Delimiter *EXPRESSION (string)*

Defines the character used to delimit fields within a CSV record. The default delimiter is `", "`.

##### A11.2.3. From *EXPRESSION (integer)*

Defines the starting record to be processed. Counting is 1-based, i.e. for the first record it is necessary to set 1 (not 0).

##### A11.2.4. To *EXPRESSION (integer)*

Defines the last record to be processed. Counting is 1-based, i.e. for the 5th record it is necessary to set 5 (not 4).

#### General

##### A11.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A11.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A11.2.7. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

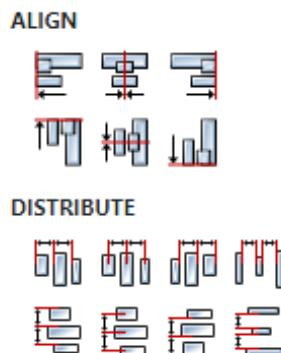

##### A11.2.8. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A11.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A11.3. Inputs

### A11.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A11.3.2. text DATA(string) / MANDATORY

The input through which the CSV string to be parsed is received. This input can be deleted (we delete it in the Flow - Inputs list) if it is not needed, i.e. if we want to parse a string obtained by evaluating an arbitrary expression set through `Input` property.

## A11.4. Outputs

### A11.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A11.4.2. result DATA(any) / MANDATORY

Data output to which the constructed value is sent. The type of that value must be specified - this should be done in the Flow - Outputs section:

Inputs	
Name	Type
text	string

Outputs	
Name	Type
result	array:struct:CountryCity

In the CSV example mentioned below, we have a CSV string that looks like this:

[

```
{
    "country": "Afghanistan",
    "city": "Kabul"
},
{
    "country": "Albania",
    "city": "Tirana"
},
{
    "country": "Algeria",
    "city": "Alger"
},
...
]
```

The constructed value returned by this Action should be of type `array:CountryCity`, where `CountryCity` is a structure that has two fields (the name of the structure `CountryCity` is arbitrarily chosen by the developer):

- `country`, whose type is `string`
- `city`, whose type is `string`

The definition of that structure looks like this in the Project editor:

The screenshot shows the Project editor interface with two main panels: 'Variables' on the left and 'Properties' on the right.

**Variables Panel:**

- Header: '(x) Variables' with icons for Global, Local, Structs (highlighted), and Enums.
- Buttons: Global (1), Local, Structs (1), Enums.
- Search bar: A dropdown arrow and a magnifying glass icon.
- Table: Shows one entry named 'CountryCity'.

**Properties Panel:**

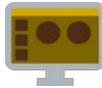

- Header: 'Properties' with icons for Global, Local, Structs (highlighted), and Enums.
- Section: 'Structure: CountryCity'
- Table: 'Fields' section with columns 'Name' and 'Type'.
 

Name	Type
country	string
city	string

## A11.5. Examples

- CSV

## A12. CSVStringify

### A12.1. Description

Converts the Flow value to a CSV string and sends it to the `result` output.

### A12.2. Properties

#### Specific

##### A12.2.1. Input *EXPRESSION (any)*

Flow value that will be converted into a CSV string.

##### A12.2.2. Delimiter *EXPRESSION (string)*

Defines the character used to delimit fields within a CSV record. The default delimiter is `", "`.

##### A12.2.3. Header *EXPRESSION (boolean)*

If it is set to `True`, the first record will contain the names of the columns.

##### A12.2.4. Quoted *EXPRESSION (boolean)*

If it is set to `True`, all non-empty fields will be quoted even if there are no characters that require quoting.

#### General

##### A12.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A12.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A12.2.7. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

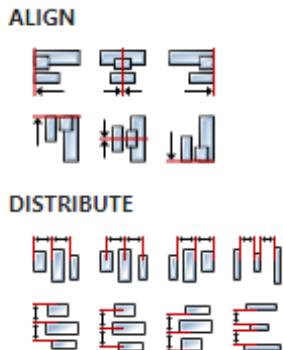

##### A12.2.8. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A12.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A12.3. Inputs

### A12.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A12.3.2. input DATA(string) / MANDATORY

The Flow value to be converted into a CSV string is received through this Input. This Input can be deleted (we delete it in the Flow - inputs list) if it is not needed, i.e. if we want to parse the string obtained by evaluating an arbitrary expression set through the `Input` property.

## A12.4. Outputs

### A12.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

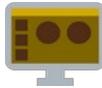

### A12.4.2. result DATA(string) / MANDATORY

The constructed CSV string is sent through this output.

## A12.5. Examples

- CSV

## A13. DateNow

### A13.1. Description

Passes the current time (data type is `Date`) through the `value` data output.

### A13.2. Properties

#### General

##### A13.2.1. Description `String`

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A13.2.2. Inputs `Array`

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A13.2.3. Outputs `Array`

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A13.2.4. Catch error `Boolean`

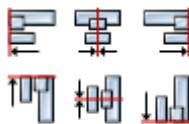

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

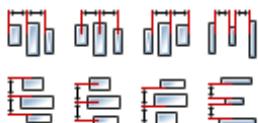

### A13.2.5. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

### A13.3. Inputs

#### A13.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A13.4. Outputs

#### A13.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A13.4.2. value DATA(date) / MANDATORY

Data output through which the current time is passed.

## A14. Delay

### A14.1. Description

This Action is used when we want to insert a pause in Flow execution.

### A14.2. Properties

#### Specific

##### A14.2.1.Milliseconds *EXPRESSION (integer)*

Pause duration in milliseconds before Flow execution resumes through sequential output `seqout`.

#### General

##### A14.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A14.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A14.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

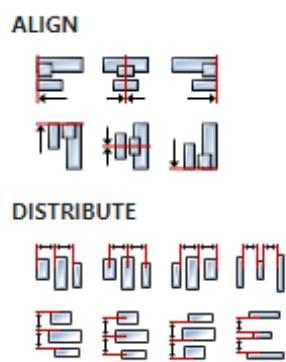

##### A14.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A14.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A14.3. Inputs

#### A14.3.1. seqin SEQ / MANDATORY

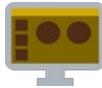

A standard sequence input.

### A14.4. Outputs

#### A14.4.1. seqout SEQ / MANDATORY

A standard sequence output.

## A15. DisconnectInstrument

### A15.1. Description

Initiates asynchronous disconnection from the instrument, i.e. the Action will not wait for us to disconnect from the instrument before exiting to `seqout`, but exits immediately. We can check whether we are disconnected or not with `instrument_variable.isConnected`. For example we can monitor this expression within the *Watch* Action in order to catch the moment when disconnection from the instrument occurred.

### A15.2. Properties

#### Specific

##### A15.2.1. Instrument *EXPRESSION (object:Instrument)*

Instrument object to disconnect from.

#### General

##### A15.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A15.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A15.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

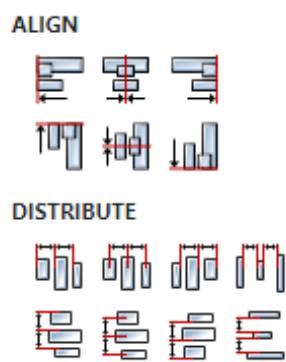

##### A15.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A15.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A15.3. Inputs

#### A15.3.1. seqin SEQ / MANDATORY

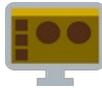

A standard sequence input.

### A15.4. Outputs

#### A15.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A16. DynamicCallAction

### A16.1. Description

Executes a User action whose name is not known in advance, i.e. it is determined during Flow execution, for example its name can come from a variable. Such a User action must not have inputs and outputs, but only *Start* and *End* Actions.

### A16.2. Properties

#### Specific

##### A16.2.1. Action *EXPRESSION (string)*

The name of the User action to be executed, obtained during Flow execution by evaluating this expression.

#### General

##### A16.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A16.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A16.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

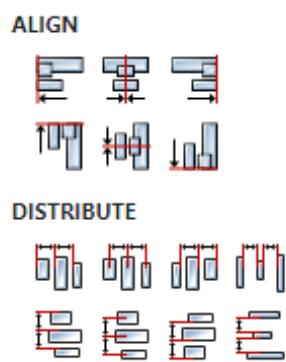

##### A16.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A16.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A16.3. Inputs

#### A16.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A16.4. Outputs

#### A16.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A17. End

### A17.1. Description

It is used to terminate the execution of a Flow.

If it is inside the page, it means the end of the application execution. If it is a *Dashboard* project that is executed within the project editor, this means switching from *Run* mode to *Edit* mode. If it is a *Dashboard* running on the instrument, the execution will be interrupted and a *Start* button will appear with which the *Dashboard* can be restarted. If it is *Dashboard* as a standalone application then the application will be closed.

If it is used within a User action, it means the end of the execution of the User action and the activation of the standard sequence line at the point where the User action was called.

This Action has no effect if it is inside a User widget in Flow.

### A17.2. Properties

#### General

##### A17.2.1. Description    String

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A17.2.2. Inputs    Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A17.2.3. Outputs    Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

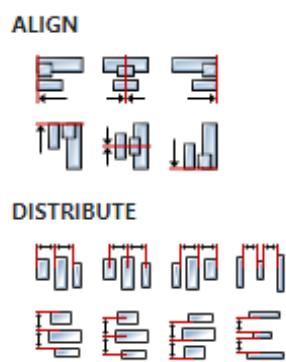

##### A17.2.4. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A17.2.5. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A17.3. Inputs

#### A17.3.1. seqin SEQ / MANDATORY

A standard sequence input.

### A17.4. Outputs

## A18. Error

### A18.1. Description

This Action throws an error that can then be caught via the *CatchError* action within the same flow in which this action is located, or within its parent Flow, i.e. of any ancestors Flow.

### A18.2. Properties

#### Specific

##### A18.2.1. Message *EXPRESSION (string)*

A text message describing the type of error, this message will be received by the *CatchError* Action.

#### General

##### A18.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A18.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A18.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

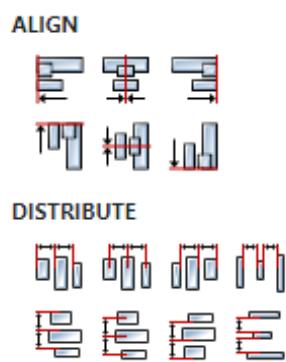

##### A18.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A18.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

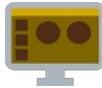

### A18.3. Inputs

#### A18.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

## A19. Eval JS

### A19.1. Description

It evaluates a JavaScript expression and sends the result through `result` output.

### A19.2. Properties

#### Specific

##### A19.2.1. Expression *TEMPLATE LITERAL*

The JavaScript expression to be evaluated. EEZ Flow expression written inside curly brackets can be inserted in several places within the expression. For example in the JavaScript expression `Math.random() * {num_items}`, this `{num_items}` is a Flow expression, i.e. it takes the value of the `num_items` variable that comes from the Flow before handing it off to JavaScript to calculate the complete expression.

#### General

##### A19.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A19.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A19.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

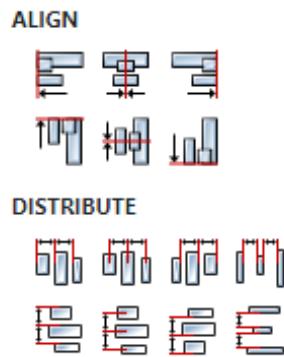

##### A19.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A19.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A19.3. Inputs

#### A19.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A19.4. Outputs

#### A19.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

#### A19.4.2. result    DATA(any) / MANDATORY

Output through which the result of JavaScript expression evaluation is sent. By default, Type of the output is set to any, so it is preferable to change it to a specific type.

## A20. Evaluate

### A20.1. Description

Evaluates the given expression and passes the result to the data output.

### A20.2. Properties

#### Specific

##### A20.2.1. Expression *EXPRESSION (any)*

Expression to be evaluated.

#### General

##### A20.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A20.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A20.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

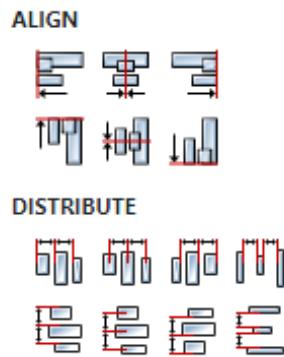

##### A20.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A20.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A20.3. Inputs

#### A20.3.1. seqin    SEQ / OPTIONAL

A standard sequence input

### A20.4. Outputs

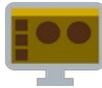

#### A20.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

#### A20.4.2. result    DATA(any) / MANDATORY

Output through which the value of the evaluated expression is passed.

## A21. ExecuteCommand

### A21.1. Description

The action is used to execute an external command, i.e. program, which can be in the PATH or the full path to the command can be specified.

### A21.2. Properties

#### Specific

##### A21.2.1. Command *EXPRESSION (string)*

The name of the command, i.e. the full file path to the command to be executed.

##### A21.2.2. Arguments *EXPRESSION (array:string)*

Array of string arguments that is passed to the command.

#### General

##### A21.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A21.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A21.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

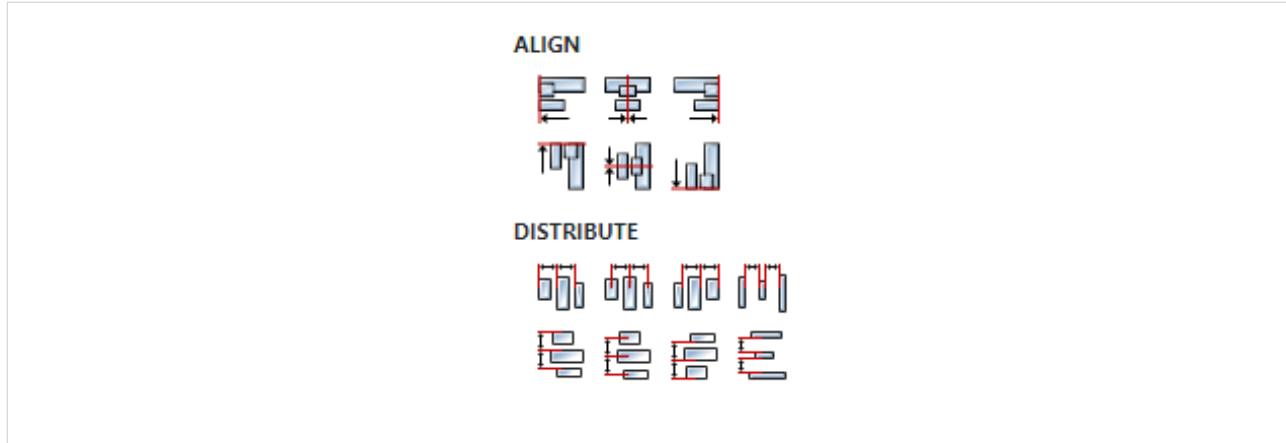

##### A21.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A21.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A21.3. Inputs

#### A21.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A21.4. Outputs

#### A21.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A21.4.2. stdout DATA(stream) / OPTIONAL

The `stream` value from `stdout` is sent through this output. That `stream` value can be collected into a string with the `CollectStream` Action, redirected to a `Terminal` widget, parsed with the `RegExp` Action, etc.

#### A21.4.3. stderr DATA(stream) / OPTIONAL

The `stream` value of `stderr` is sent through this output. That `stream` value can be collected into a string with the `CollectStream` Action, redirected to a `Terminal` widget, parsed with the `RegExp` Action, etc.

#### A21.4.4. finished DATA(integer) / OPTIONAL

If the command completed successfully, Flow execution continues through this output. If an error has occurred, an error is thrown that can be caught if 'Catch error' is enabled.

### A21.5. Examples

- *RegExp Stream*

## A22. FileAppend

### A22.1. Description

Appends data to a file. It will create the file if it doesn't already exist. The data can be a string or a blob.

### A22.2. Properties

#### Specific

##### A22.2.1. File path *EXPRESSION (string)*

The full path of the file to be written.

##### A22.2.2. Content *EXPRESSION (string)*

Content to be written. It can be a string or a blob. If the content is a blob, the `encoding` property is ignored.

##### A22.2.3. Encoding *EXPRESSION (string)*

Encoding type of string content. The following values are allowed: "ascii", "base64", "hex", "ucs2", "ucs-2", "utf16le", "utf-16le", "utf8", "utf-8", "binary" or "latin1".

#### General

##### A22.2.4. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A22.2.5. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A22.2.6. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A22.2.7. Catch error *Boolean*

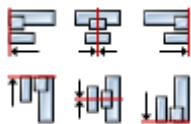

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

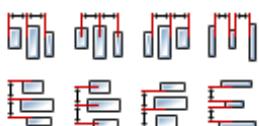

### A22.2.8. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

### A22.3. Inputs

#### A22.3.1. seqin SEQ / OPTIONAL

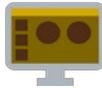

A standard sequence input.

### A22.4. Outputs

#### A22.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A23. FileOpenDialog

### A23.1. Description

Displays the system file open dialog and sends the set file path to the `file_path` output.

### A23.2. Properties

#### Specific

##### A23.2.1. Filters *EXPRESSION (array:string)*

If we want to limit which types of files appear inside the file open dialog, then we can specify the filter list as `array:string`, for example `["PNG Images|png", "JPG Images|jpg", "GIF Images|gif"]`. This is an optional property and if it is not set then all files will be displayed.

#### General

##### A23.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A23.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A23.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

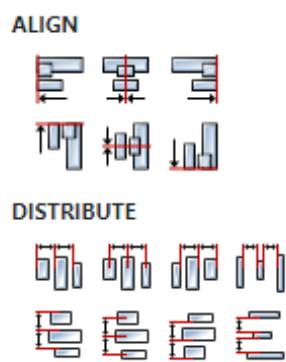

##### A23.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A23.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A23.3. Inputs

#### A23.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A23.4. Outputs

#### A23.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A23.4.2. file\_path DATA(string) / MANDATORY

Output to which the set file path is sent.

## A24. FileRead

### A24.1. Description

Reads the contents of a file as either a string or blob and sends it to the `content` output

### A24.2. Properties

#### Specific

##### A24.2.1. File path *EXPRESSION (string)*

The full path of the file to be read.

##### A24.2.2. Encoding *EXPRESSION (string)*

Encoding of the input data. Possible values are: "ascii", "base64", "hex", "ucs2", "ucs-2", "utf16le", "utf-16le", "utf8", "utf-8", "binary" or "latin1".

If encoding is "binary" then the blob value is returned, otherwise the string value is returned.

#### General

##### A24.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A24.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A24.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A24.2.6. Catch error *Boolean*

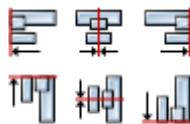

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

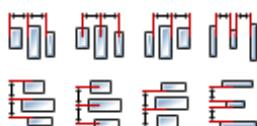

### A24.2.7. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### ALIGN

#### DISTRIBUTE

### A24.3. Inputs

#### A24.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A24.4. Outputs

#### A24.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A24.4.2. content DATA(any) / MANDATORY

The read content of the file is sent through this output.

### A24.5. Examples

- *JSON*
- *CSV*
- *EEZ Chart*

## A25. FileSaveDialog

### A25.1. Description

Displays the system file save dialog and sends the set file path to the `file_path` output.

### A25.2. Properties

#### Specific

##### A25.2.1. File name *EXPRESSION (string)*

The file name to be used by default.

##### A25.2.2. Filters *EXPRESSION (array:string)*

If we want to limit which types of files appear inside the file save dialog, then we can specify the filter list as `array:string`, for example `["PNG Images|png", "JPG Images|jpg", "GIF Images|gif"]`. This is an optional property and if it is not set then all files will be displayed.

#### General

##### A25.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A25.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A25.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A25.2.6. Catch error *Boolean*

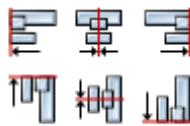

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

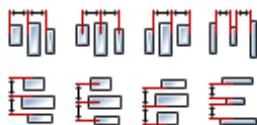

### A25.2.7. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

### A25.3. Inputs

#### A25.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A25.4. Outputs

#### A25.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A25.4.2. file\_path DATA(string) / MANDATORY

Output to which the set file path is sent.

### A25.5. Examples

- *Screen Capture*

## A26. **FileWrite**

### A26.1. *Description*

Writes data to a file, replacing the file if it already exists. Data can be a string or a blob.

### A26.2. *Properties*

#### Specific

##### A26.2.1. **File path** *EXPRESSION (string)*

The full path of the file to be written.

##### A26.2.2. **Content** *EXPRESSION (string)*

The content to be written can be a string or a blob. If the content is a blob, the `encoding` property is ignored.

##### A26.2.3. **Encoding** *EXPRESSION (string)*

Encoding of the content. Possible values are: `"ascii"`, `"base64"`, `"hex"`, `"ucs2"`, `"ucs-2"`, `"utf-16le"`, `"utf-16le"`, `"utf8"`, `"utf-8"`, `"binary"` or `"latin1"`.

#### General

##### A26.2.4. **Description** *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A26.2.5. **Inputs** *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A26.2.6. **Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A26.2.7. **Catch error** *Boolean*

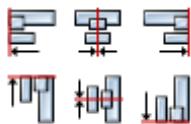

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

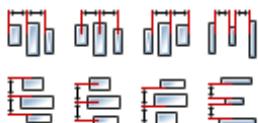

### A26.2.8. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

### A26.3. Inputs

#### A26.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A26.4. Outputs

#### A26.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A26.5. Examples

- CSV
- Screen Capture

## A27. GetInstrument

### A27.1. Description

Retrieves an instrument object by its ID. The instrument ID can be found in these two places: Instrument Properties when the instrument is selected on the Instruments Home page and in the header of the Terminal tab of the instrument.

The screenshot shows the Instruments Home page. At the top, there are tabs: Instruments (selected), Add Instrument, Deleted Instruments, History, Shortcuts and Groups, Notebooks, and a close button. Below the tabs, there is a list of instruments. One instrument, labeled 'BB3 #2', is shown with a red circle indicating it is 'Disconnected'. Below this, a larger card is highlighted in red and labeled 'Selected instrument'. This card also shows 'BB3 #2' and 'Disconnected'. To the right of the cards, a sidebar titled 'Actions' contains buttons for Open in Tab, Open in New Window, and Delete. The 'Properties' section displays the following information:

Instrument	EEZ BB3 STM32
ID	55 <b>Instrument ID</b>
Label	BB3 ATE
IDN	Envox,EEZ BB3 (STM32),001C003933385107
<input type="checkbox"/> Auto connect	
Connection	
Interface	Ethernet

The screenshot shows the details page for the instrument 'BB3 ATE'. The title bar says 'Instrument ID' and the instrument ID '55' is highlighted with a red box. Below the title bar, there is a 'Connect' button. On the left, a sidebar has links for Start Page, Dashboard, and Terminal. The main content area is titled 'LATEST HISTORY EVENT' and shows a log entry: '04/10/2022 5:51:31 PM DISCONNECTED after 58 seconds'.

Use this Action when you want to access a specific instrument, i.e. you don't want to use a dialog box as a method for selecting an instrument.

### A27.2. Properties

#### Specific

##### A27.2.1. Instrument ID *EXPRESSION (string)*

The ID of the instrument whose object we want to retrieve.

#### General

**A27.2.2. Description** *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

**Flow****A27.2.3. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

**A27.2.4. Outputs** *Array*

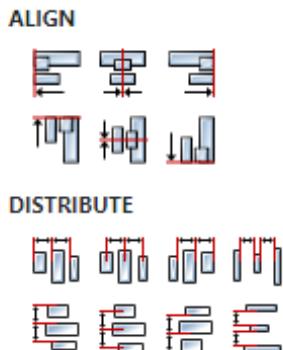

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**A27.2.5. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**Position and size****A27.2.6. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**A27.3. Inputs****A27.3.1. seqin** *SEQ / MANDATORY*

A standard sequence input.

## A27.4. Outputs

### A27.4.1. seqout    SEQ / OPTIONAL

A standard sequence output

### A27.4.2. instrument    DATA(*object:Instrument*) / MANDATORY

The retrieved object is sent to this output.

## A28. GetInstrumentProperties

### A28.1. Description

Using this Action, we can retrieve the instrument properties that are defined within the IEXT instrument extension.

For example, in the `Rigol Waveform Data` example, we want to retrieve how many channels the instrument has and what color is used for each channel. First, we can look at all the properties of the Rigol DS1000Z instrument:

The screenshot shows the Envoy software interface. On the left, there is a list of installed instruments: Rigol DS1074B (Installed), Rigol DS1074Z (Installed), and Rigol DS1074Z-S (Installed). Each entry includes the instrument name, model, version (1.0.2), and manufacturer (Envox). In the center, a detailed view of the Rigol DS1074Z is shown, including its model number, a brief description, a large image of the oscilloscope, and a "Change image" button. Below the image, there is a "Properties" tab (which is selected, indicated by a red arrow) and a "Shortcuts" tab. The "Properties" tab displays a JSON-like code block containing instrument configuration details. On the right side of the interface, there is a "Versions" dropdown set to 1.0.2, a "Uninstall" button, and some system information like the MAC address (0fbcc69b-56f4-46c1-e1f2-a9492c9dabfd).

```
1: {  
2:   "connection": {  
3:     "ethernet": {  
4:       "port": 5555  
5:     },  
6:     "usbTNC": {  
7:       "idVendor": "0x1ab1",  
8:       "idProduct": "0x04ce"  
9:     }  
10: }  
11: }
```

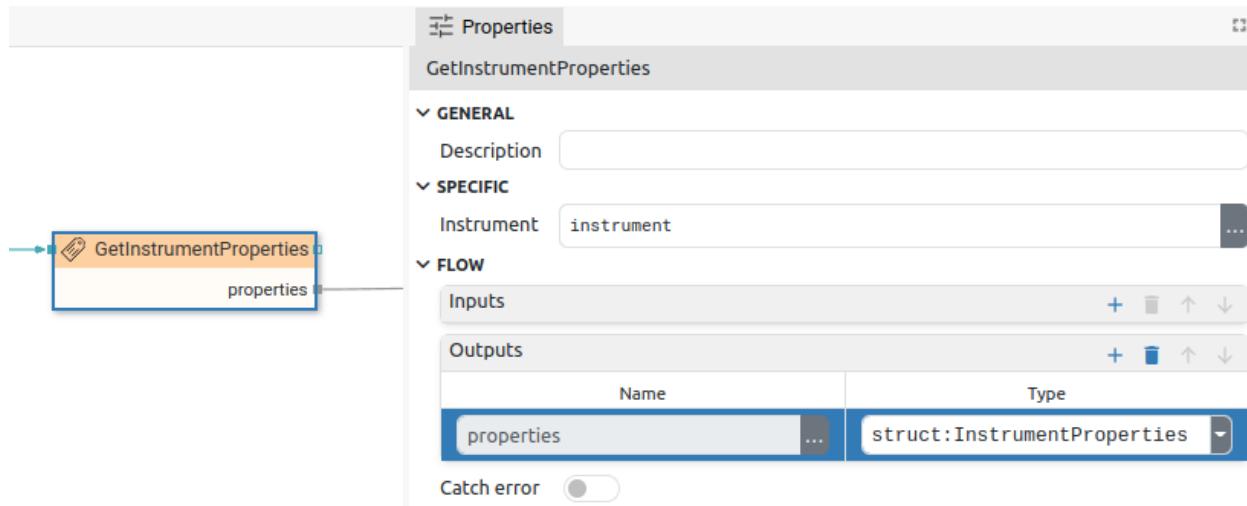

Now it is necessary to define the Flow variable type in which we want to store the properties we are interested in. In this case, we define the type `struct:InstrumentProperties` defined as follows:

The screenshot shows the Envoy software interface. On the left, under the "Structs" tab, there is a list of structures: InstrumentPropertiesChannel, InstrumentProperties, and Channel. The "InstrumentProperties" structure is currently selected. In the main panel, the "Properties" tab is active, showing the structure definition. The "Name" field is set to "InstrumentProperties". Under the "Fields" section, there is a table with one row. The "Name" column contains "channels" and the "Type" column is "array:struct:InstrumentPropertiesChannel".

The `InstrumentProperties` structure has one member called `channels`, which is of type `array:InstrumentPropertiesChannel`, and which is defined as follows:

The screenshot shows the Envoy software interface. On the left, under the "Structs" tab, there is a list of structures: InstrumentPropertiesChannel, InstrumentProperties, and Channel. The "InstrumentPropertiesChannel" structure is currently selected. In the main panel, the "Properties" tab is active, showing the structure definition. The "Name" field is set to "InstrumentPropertiesChannel". Under the "Fields" section, there is a table with two rows. The first row has "Name" as "color" and "Type" as "string". The second row has "Name" as "colorInverse" and "Type" as "string".

And now using this Action in one step we can retrieve information about all channels:

After we have retrieved the properties, we can find out the number of channels with `Array.length(properties.channels)`, and the color, for example, of the 1st channel with: `properties.channels[0].color`.

## A28.2. Properties

### Specific

#### A28.2.1. Instrument *EXPRESSION (object:Instrument)*

The instrument whose properties will be retrieved.

### General

#### A28.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

### Flow

#### A28.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

#### A28.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### A28.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

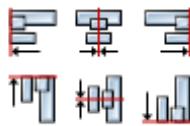

put. The data that will be passed through that output is the textual description of the error.

## Position and size

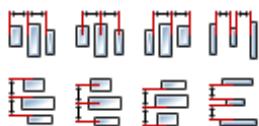

### A28.2.6. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

### A28.3. Inputs

#### A28.3.1. seqin    SEQ / MANDATORY

A standard sequence input.

### A28.4. Outputs

#### A28.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

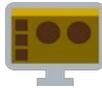

#### A28.4.2. properties    DATA(any) / MANDATORY

Retrieved properties are sent to this output.

### A28.5. Examples

- *Rigol Waveform Data*

## A29. HTTP

### A29.1. Description

Sends HTTP requests and returns the response.

### A29.2. Properties

#### Specific

##### A29.2.1. Method *Enum*

HTTP methods used: GET, POST, PUT, PATCH, DELETE, HEAD, OPTIONS, CONNECT or TRACE.

##### A29.2.2. Url *EXPRESSION (string)*

The url of the request.

##### A29.2.3. Headers *Array*

List of headers sent to the server. A header name and a string value should be set for each item.

##### A29.2.4. Body *EXPRESSION (string)*

The body of the message that is sent to the server if the POST, PUT or PATCH method is selected.

#### General

##### A29.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A29.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A29.2.7. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A29.2.8. Catch error *Boolean*

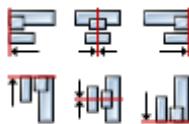

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

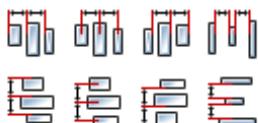

### A29.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

## A29.3. Inputs

### A29.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

## A29.4. Outputs

### A29.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A29.4.2. status DATA(integer) / OPTIONAL

The status code ([link](#)) of the response.

### A29.4.3. result DATA(string) / OPTIONAL

Message body of received response.

## A29.5. Examples

- Simple HTTP

## A30. Input

### A30.1. Description

Adds data input to a user action or user widget.

### A30.2. Properties

#### Specific

##### A30.2.1. Name *String*

Input name.

##### A30.2.2. Type *String*

Input data type.

#### General

##### A30.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A30.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A30.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

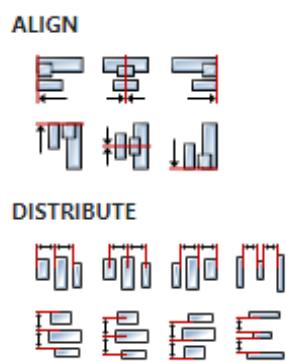

##### A30.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A30.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A30.3. Inputs

### A30.4. Outputs

#### A30.4.1. seqout    SEQ / MANDATORY

The data received by the caller of the user action is passed through this output.

## A31. IsTrue

### A31.1. Description

The set expression is evaluated and if it is `true`, the Flow execution continues through the `Yes` output, otherwise on the `No` output. At least one of those two outputs must be connected by a line to an input.

By default, when this action is added to the Flow, a `Value` input is added and it is tested whether it is `true` or `false`. If we want to test another expression, we should delete that input in the Flow section of the property and enter the expression we want.

### A31.2. Properties

#### Specific

##### A31.2.1. Value *EXPRESSION (boolean)*

Expression whose result is tested.

#### General

##### A31.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A31.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A31.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

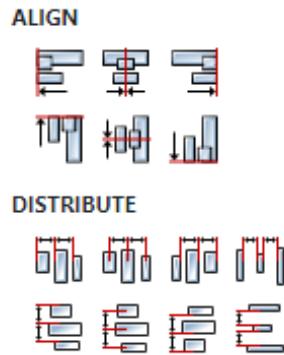

##### A31.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A31.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A31.3. Inputs

#### A31.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

#### A31.3.2. value DATA(any) / MANDATORY

The input through which the Value to be tested is received. This input can be deleted (we delete it in the Flow - Inputs list) if it is not needed, i.e. if you want to test another expression.

### A31.4. Outputs

#### A31.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A31.4.2. Yes SEQ / OPTIONAL

Output that will be used to continue execution of the Flow if the value of the expression is `true`.

#### A31.4.3. No SEQ / OPTIONAL

Output that will be used to continue execution of the Flow if the value of the expression is `false`.

## A32. JSONParse

### A32.1. Description

Parses a JSON string, constructs a value of the set type and sends it through the `result` output.

### A32.2. Properties

#### Specific

##### A32.2.1. Value *EXPRESSION (string)*

JSON string to be parsed.

#### General

##### A32.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A32.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A32.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

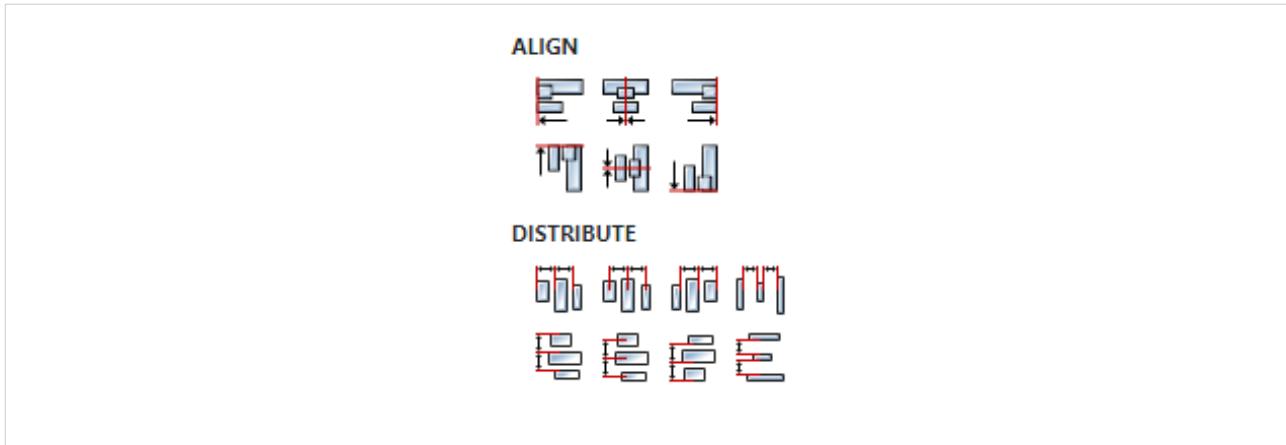

##### A32.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A32.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A32.3. Inputs

#### A32.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

#### A32.3.2. text DATA(string) / MANDATORY

The input through which the JSON string to be parsed is received. This input can be deleted (we delete it in the Flow - Inputs list) if it is not needed, i.e. if we want to parse a string obtained by evaluating an arbitrary expression set through `Value` property.

### A32.4. Outputs

#### A32.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A32.4.2. result DATA(any) / MANDATORY

Data output to which the constructed value is sent. The type of that value must be specified – this should be done in the Flow – Outputs section:

**▼ FLOW**

Inputs	
Name	Type
text	string

Outputs	
Name	Type
result	array:struct:CountryCity

In the JSON example mentioned below, we have a JSON string that looks like this:

```
[
  {
    "country": "Afghanistan",
    "city": "Kabul"
  },
  {
    "country": "Albania",
    "city": "Tirana"
```

```

},
{
    "country": "Algeria",
    "city": "Alger"
},
...
]

```

The constructed value returned by this Action should be of type `array:CountryCity`, where `CountryCity` is a structure that has two fields (the name of the structure `CountryCity` is arbitrarily chosen by the developer):

- `country`, whose type is `string`
- `city`, whose type is `string`

The definition of that structure looks like this in the Project editor:

The screenshot shows the Project editor interface with the 'Structs' tab selected. A structure named 'CountryCity' is defined with two fields: 'country' (Type: string) and 'city' (Type: string).

Name	Type
country	string
city	string

### A32.5. Examples

- `JSON`

## A33. JSONStringify

### A33.1. Description

Converts the Flow `Value` to a JSON string and sends it to the `result` output.

### A33.2. Properties

#### Specific

##### A33.2.1. Value *EXPRESSION (any)*

Flow value that will be converted into a JSON string.

##### A33.2.2. Indentation *EXPRESSION (integer)*

The indentation to be used in the generated JSON string.

#### General

##### A33.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A33.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A33.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

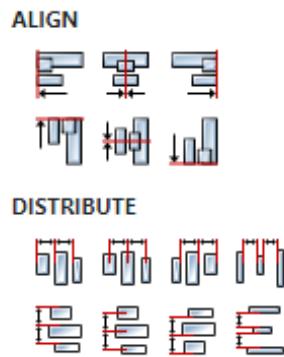

##### A33.2.6. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A33.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A33.3. Inputs

#### A33.3.1. seqin *SEQ / OPTIONAL*

A standard sequence input.

### A33.4. Outputs

#### A33.4.1. seqout *SEQ / OPTIONAL*

A standard sequence output.

#### A33.4.2. result *DATA(string) / MANDATORY*

The constructed JSON string is sent through this output.

### A33.5. Examples

- *JSON*

## A34. Label IN

### A34.1. Description

This action is used in combination with `Label OUT` action. All lines entering `Label OUT` will end up through `Label IN` with the same label name within the same flow (i.e. *Page* or *User Action*). So, "jumping" from one flow to another is not allowed. There can be multiple `Label OUT` and only one `Label IN` with the same label name.

### A34.2. Properties

#### Specific

##### A34.2.1. Label *String*

The name of the label that connects the `Label IN` and `Label OUT` actions.

#### General

##### A34.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A34.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A34.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

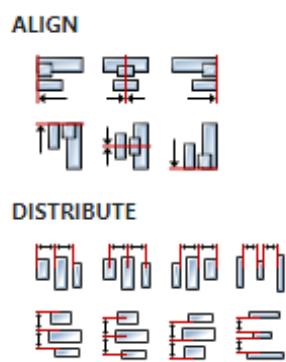

##### A34.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A34.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A34.3. Outputs

#### A34.3.1. seqout SEQ / MANDATORY

A standard sequence output.

## A35. Label OUT

### A35.1. Description

This action is used in combination with `Label IN` action. All lines entering `Label OUT` will end up through `Label IN` with the same label name within the same flow (i.e. *Page* or *User Action*). So, "jumping" from one flow to another is not allowed. There can be multiple `Label OUT` and only one `Label IN` with the same label name.

### A35.2. Properties

#### Specific

##### A35.2.1. Label *String*

The name of the label that connects the `Label IN` and `Label OUT` actions.

#### General

##### A35.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A35.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A35.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

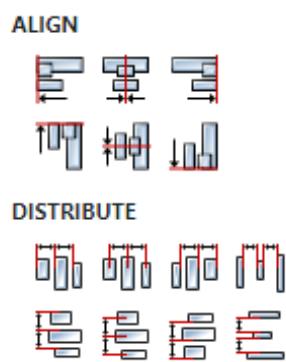

##### A35.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A35.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A35.3. Inputs

#### A35.3.1. seqin SEQ / MANDATORY

A standard sequence input.

## A36. Log

### A36.1. Description

The set expression is evaluated and the result is displayed in the *Logs* panel.

### A36.2. Properties

#### Specific

##### A36.2.1. Value *EXPRESSION (string)*

Expression whose result will be displayed in the *Logs* panel.

#### General

##### A36.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A36.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A36.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

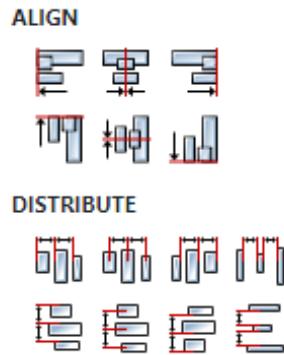

##### A36.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A36.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A36.3. Inputs

#### A36.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

#### A36.3.2. value DATA(string) / MANDATORY

The input through which the Value that is displayed in the *Log* panel is received. This input can be deleted (it is deleted in the Flow - Inputs list) if it is not needed, i.e. if some other expression is displayed.

### A36.4. Outputs

#### A36.4.1. seqout SEQ / OPTIONAL

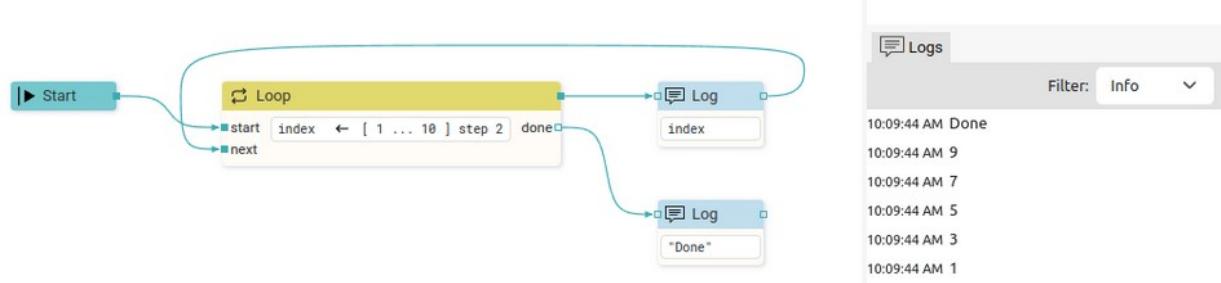

A standard sequence output.

## A37. Loop

### A37.1. Description

This Action is used to execute a specific part of the Flow in a loop. The Action should be placed at the beginning of the part of the Flow that will be executed in a loop and is entered at the `Start` input, and at the end of that part of the Flow it should be returned to this Action, but now through the `Next` input. Each time the Flow passes through this Action, the value of the set variable will change from the `From` to the `To` value with the `Step` value. Flow execution will go through  $(\text{From} - \text{To} + 1) / \text{Math.abs}(\text{step})$  times before the iteration completes, and passes through the `Done` output. If we want to stop the iteration before the `To` value is reached, then we simply don't need to return to the `Next` input. Also, it is possible to use `SetVariable` to change the variable by which it is iterated, and thus skip one or more steps.

### A37.2. Properties

#### Specific

##### A37.2.1. Variable *ASSIGNABLE EXPRESSION (integer)*

A variable that determines the number of passes through the loop and whose value will be changed and tested to see if a new iteration is needed.

##### A37.2.2. From *EXPRESSION (integer)*

The initial value of the variable.

##### A37.2.3. To *EXPRESSION (integer)*

The final value of the variable.

##### A37.2.4. Step *EXPRESSION (integer)*

The value by which the variable is changed on each pass. It can be a positive or negative number.

#### General

##### A37.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A37.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### A37.2.7. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

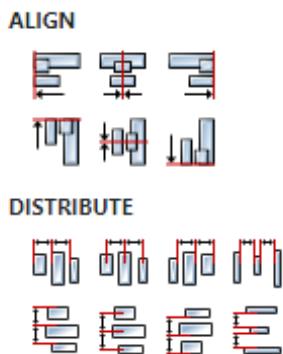

### A37.2.8. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A37.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A37.3. Inputs

### A37.3.1. start SEQ / MANDATORY

When this input is passed, the variable is set to the `From` value and Flow execution continues through `seqout`.

### A37.3.2. next SEQ / MANDATORY

When this input is passed, the variable is changed by the `Step` value. It is tested whether it is less than or equal to `To` value if `Step` is positive, or whether it is greater than or equal to if `Step` is negative.

If the variable has not exceeded the `To` value, then Flow execution continues through `seqout`, otherwise it continues through `Done` output.

## A37.4. Outputs

### A37.4.1. seqout SEQ / MANDATORY

Flow execution continues through this output for the duration of the iteration.

**A37.4.2. done** *SEQ / OPTIONAL*

Flow execution continues through this output when the iteration is complete.

**A37.5. Examples**

- *Loop*

### A38.1. Description

Performs one or more LVGL specific actions.

### A38.2. Properties

#### Specific

##### A38.2.1. Actions *Array*

List of actions to be executed. The following actions are available:

- **Change Screen** Changes the active page. The following options are available:
  - **Previous screen** - if it is checked, it will go to the previous screen, otherwise you should select the page you want to display.
  - **Screen** - name of the page to be displayed.
- **Fade mode** - selection of animation when moving from the previous page to a new page. The following options are available:
  - **None** - switch immediately after delay ms
  - **Over left / Over right / Over top / Over bottom** - move the new page over the others towards the given direction.
  - **Move Left/Right/Top/Bottom** - move both the old and new pages towards the given direction.
  - **Fade in / Fade out** - fade the new page over the old page, or vice versa.
  - **Out left / Out right / Out top / Out bottom** - move out the old page over the current one towards the given direction.
- **Speed** - animation duration in milliseconds.
- **Delay** - delay in milliseconds before the animation starts.
- **Play Animation** Animates the selected Widget property. The following options are available:
  - **Target** - Widget whose property is animated
  - **Property** - Widget property that is animated.
  - **Start** - initial property value.
  - **End** - the final value of the property.
  - **Delay** - delay in milliseconds before the animation starts.
  - **Time** - the total duration of the animation in milliseconds.
  - **Relative** - determines whether **Start** and **End** values are relative to the current value or are absolute values.
  - **Instant** - if checked apply the start value immediately, otherwise apply the start value after a delay when the animation really starts.
  - **Path** - determines the animation curve. The following options are available:
    - **Linear** - calculate the current value of an animation applying linear characteristic
    - **Ease in** - calculate the current value of an animation slowing down the start phase
    - **Ease out** - calculate the current value of an animation slowing down the end phase
    - **Ease in out** - calculate the current value of an animation applying an "S" characteristic (cosine)
    - **Overshoot** - calculate the current value of an animation with overshoot at the end

- `Bounce` - calculate the current value of an animation with 3 bounces
- `Set Property` Changes the value of the selected property for the selected Widget. The following options are available:
  - `Target type` - The type of Widget that changes.
  - `Target` - Widget whose property is changed.
  - `Property` - the property that is being changed.
  - `Value` - new property value.
  - `Animated` - if there is a possibility to animate the property, then you can choose to make the change animated. For example for *Slider*, changing position *slider* (Value property) can be animated.

## General

### A38.2.2. Description `String`

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

## Flow

### A38.2.3. Inputs `Array`

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### A38.2.4. Outputs `Array`

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

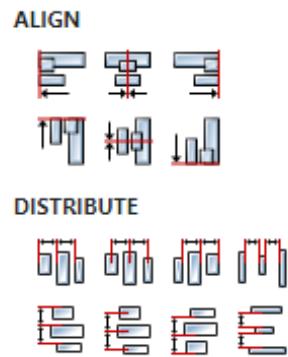

### A38.2.5. Catch error `Boolean`

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A38.2.6. Align and distribute `Any`

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A38.3. Inputs

#### A38.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A38.4. Outputs

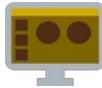

#### A38.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A38.5. Examples

- *Change Screen*

## A39. Modbus

### A39.1. Description

This action is used to send Modbus commands to the Modbus server. If coils are read, then the read value will be passed through output `values` as a value of type `array:boolean`, and in the case of registers, then a value of type `array:integer` will be passed through output `values`.

### A39.2. Properties

#### Specific

##### A39.2.1. Connection *EXPRESSION (any)*

Serial connection used to send Modbus commands.

##### A39.2.2. Server address *EXPRESSION (integer)*

A number between 0 and 255 used to select the Modbus server on the serial connection.

##### A39.2.3. Command *Enum*

Command to be sent:

- 01 (0x01) Read Coils
- 02 (0x02) Read Discrete Inputs
- 03 (0x03) Read Holding Registers
- 04 (0x04) Read Input Registers
- 05 (0x05) Write Single Coil
- 06 (0x06) Write Single Register
- 15 (0x0F) Write Multiple Coils
- 16 (0x10) Write Multiple Registers

##### A39.2.4. Register address *EXPRESSION (integer)*

Register address for single write: 05 (0x05) Write Single Coil or 06 (0x06) Write Single Register.

##### A39.2.5. Starting register address *EXPRESSION (integer)*

The address of the first register for multiple read and write.

##### A39.2.6. Quantity of registers *EXPRESSION (integer)*

The register number for multiple read and write.

##### A39.2.7. Coil value *EXPRESSION (boolean)*

Coil value (`boolean`) that is sent during a single write (i.e. when 05 (0x05) Write Single Coil is used).

##### A39.2.8. Register value *EXPRESSION (integer)*

Register value (`integer`) that is sent during a single write (i.e. when 06 (0x06) Write Single Register is used).

##### A39.2.9. Coil values *EXPRESSION (array:boolean)*

Coil values (of type `array:boolean`) when multiple writes are performing.

##### A39.2.10. Register values *EXPRESSION (array:integer)*

Registar values (of type `array:integer`) when multiple writes are performing.

**A39.2.11. Timeout (ms) EXPRESSION (integer)**

Maximum waiting time for server response. It is set in milliseconds.

**General****A39.2.12. Description String**

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

**Flow****A39.2.13. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

**A39.2.14. Outputs Array**

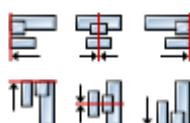

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**A39.2.15. Catch error Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**Position and size****A39.2.16. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE**

### **A39.3. Inputs**

#### **A39.3.1. seqin    SEQ / OPTIONAL**

A standard sequence input.

### **A39.4. Outputs**

#### **A39.4.1. seqout    SEQ / OPTIONAL**

A standard sequence output.

## A40. MQTTConnect

### A40.1. Description

This Action initiates a connection to the MQTT server, and if the connection is successful, a Connect event will be sent, or an Error event if an error occurred. If an error occurred or the once established connection was interrupted, a periodic reconnect will be attempted until the connection is re-established, which will be reported by sending a Reconnect event. All this happens asynchronously in the background, until `MQTTDisconnect` is called, and any state change will be reported with an event that can be processed through the `MQTTEvent` Action.

### A40.2. Properties

#### Specific

##### A40.2.1. Connection *EXPRESSION (object:MQTTConnection)*

The name of the MQTT connection that will be used to establish a connection with the server.

#### General

##### A40.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A40.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A40.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

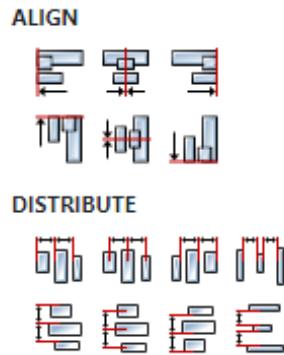

##### A40.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A40.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A40.3. Inputs

#### A40.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A40.4. Outputs

#### A40.4.1. seqout SEQ / OPTIONAL

A standard sequence output. Flow execution continues immediately through this output, and in the background it tries to establish a connection with the server.

### A40.5. Examples

- *MQTT*

## A41. MQTTDisconnect

### A41.1. Description

Initiates the termination of the connection with the server, which will be confirmed with the `Close` event and then the `End` event.

### A41.2. Properties

#### Specific

##### A41.2.1. Connection *EXPRESSION (object:MQTTConnection)*

The name of the MQTT connection to the server to which the communication will be terminated.

#### General

##### A41.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A41.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A41.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

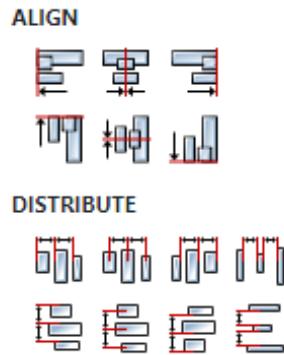

##### A41.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A41.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A41.3. Inputs

#### A41.3.1. seqin    *SEQ / OPTIONAL*

A standard sequence input.

### A41.4. Outputs

#### A41.4.1. seqout    *SEQ / OPTIONAL*

A standard sequence output. Flow execution continues immediately through this output, and in the background it tries to disconnect from the server.

### A41.5. Examples

- *MQTT*

## A42. MQTTEvent

### A42.1. Description

With this Action we can add one or more event handlers that can be received by the MQTT connection. After this Action is executed, the *MQTTConnect* Action can be called.

### A42.2. Properties

#### Specific

##### A42.2.1. Connection *EXPRESSION (object:MQTTConnection)*

MQTT connection to the server whose events are to be handled.

##### A42.2.2. Event handlers *Array*

List of events to be handled. For each item in the list, it will be necessary to select `Event`, `Handler type` and optionally `Action`. `Event` is the type of event we want to handle and the possible values are:

- `Connect` – It is sent in case of successful connection or reconnect.
- `Reconnect` – Sent when attempting to reconnect after a connection has been terminated.
- `Close` – It is sent after the connection is terminated.
- `Disconnect` – Sent when a disconnect packet is received by the broker.
- `Offline` – Sent when the client goes offline.
- `End` – Sent when the *MQTTDisconnect* Action is performed.
- `Error` – Sent when the client cannot connect or a parsing error has occurred.
- `Message` – It is sent when the client receives a published packet from the server for the topic we previously subscribed to with the *MQTTSubscribe* Action. Data of the type `struct: $MQTTMessage` is sent through the output, it is a system structure that has these members:
  - `topic` – The name of the topic for which the packet was published.
  - `payload` – Content of the received message.

`Handler type` can be `Flow` or `Action`. If `Flow` is selected then an output will be added through which the Flow execution continues if the event is sent. If `Action` is selected, then `Action` must also be set, i.e. the name of the User action that is executed when the event is received.

#### General

##### A42.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A42.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A42.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

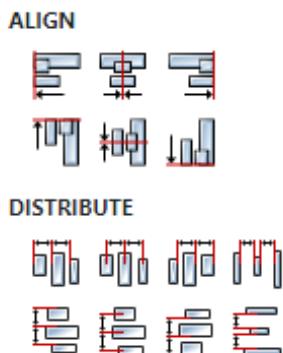

#### A42.2.6. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A42.2.7. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A42.3. Inputs

#### A42.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A42.4. Outputs

#### A42.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

### A42.5. Examples

- *MQTT*

## A43. MQTTInit

### A43.1. Description

Creates and initializes an MQTT connection object with connection parameters that are defined through properties. This Action must be executed first, and after it the *MQTTEvent* Action must be called.

### A43.2. Properties

#### Specific

##### A43.2.1. Connection *ASSIGNABLE EXPRESSION (object:MQTTConnection)*

Connection object of type `object:MQTTConnection` which will be created and initialized.

##### A43.2.2. Protocol *EXPRESSION (string)*

The protocol used for the connection. Possible values are `"mqtt"` or for secure connection `"mqtts"`

##### A43.2.3. Host *EXPRESSION (string)*

The name of the MQTT server to connect to.

##### A43.2.4. Port *EXPRESSION (integer)*

The port number that will be used for the connection. The default is `1883`.

##### A43.2.5. User name *EXPRESSION (string)*

Username to be used for connection authorization. Can be left blank if not used.

##### A43.2.6. Password *EXPRESSION (string)*

User password to be used for connection authorization. Can be left blank if not used.

#### General

##### A43.2.7. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A43.2.8. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A43.2.9. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through

that output.

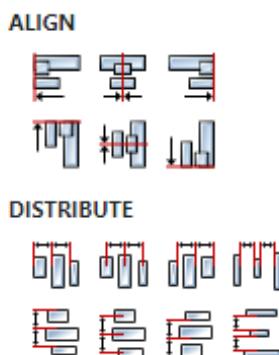

#### A43.2.10. Catch error   Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A43.2.11. Align and distribute   Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A43.3. Inputs

#### A43.3.1. seqin   SEQ / OPTIONAL

A standard sequence input.

### A43.4. Outputs

#### A43.4.1. seqout   SEQ / OPTIONAL

A standard sequence output.

### A43.5. Examples

- *MQTT*

## A44. MQTT Publish

### A44.1. Description

Publishing a message in the selected topic.

### A44.2. Properties

#### Specific

##### A44.2.1. Connection *EXPRESSION (object:MQTTConnection)*

The name of the connection to the MQTT server.

##### A44.2.2. Topic *EXPRESSION (string)*

The topic under which the message will be published.

##### A44.2.3. Payload *EXPRESSION (string)*

Message to be published.

#### General

##### A44.2.4. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A44.2.5. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A44.2.6. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A44.2.7. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

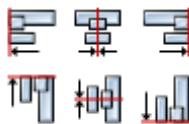

#### Position and size

##### A44.2.8. Align and distribute *Any*

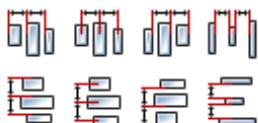

Alignment icons and component distribution. Alignment icons appear when two or more compo-

nents are selected, and distribution icons appear when three or more components are selected.

**ALIGN**

**DISTRIBUTE**

### A44.3. Inputs

#### A44.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A44.4. Outputs

#### A44.4.1. seqout SEQ / OPTIONAL

A standard sequence output

### A44.5. Examples

- MQTT

## A45. MQTTSubscribe

### A45.1. Description

This Action must be performed immediately after successfully connecting to the MQTT server, for each topic to which we want to subscribe. If a packet has been published by the server for this topic, we will receive information about it via the *MQTTEvent* Action.

### A45.2. Properties

#### Specific

##### A45.2.1. Connection *EXPRESSION (object:MQTTConnection)*

The name of the connection to the MQTT server.

##### A45.2.2. Topic *EXPRESSION (string)*

The name of the topic to which we want to subscribe. A subscription may be to an explicit topic, in which case only messages to that topic will be received, or it may include wildcards. Two wildcards are available, + or #. + can be used as a wildcard for a single level of hierarchy. It could be used with the topic above to get information on all computers and hard drives as follows:

sensors/+/temperature/+

As another example, for a topic of `a/b/c/d`, the following example subscriptions will match:

a/b/c/d  
+/b/c/d  
a/+/c/d  
a/+/+/d  
+/+/+/+

The following subscriptions will not match:

a/b/c  
b/+/c/d  
+/-/+

# can be used as a wildcard for all remaining levels of hierarchy. This means that it must be the final character in a subscription. With a topic of `a/b/c/d`, the following example subscriptions will match:

a/b/c/d  
#  
a/#  
a/b/#  
a/b/c/#  
+/b/c/#

#### General

##### A45.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A45.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check to*

check whether a data line that transmits data of that type is connected to the input or not.

#### A45.2.5. Outputs    Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### A45.2.6. Catch error    Boolean

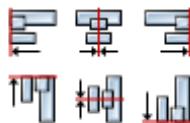

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

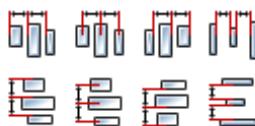

#### A45.2.7. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### ALIGN

##### DISTRIBUTE

### A45.3. Inputs

#### A45.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A45.4. Outputs

#### A45.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

### A45.5. Examples

- *MQTT*

## A46. MQTTUnsubscribe

### A46.1. Description

Unsubscribe from a topic.

### A46.2. Properties

#### Specific

##### A46.2.1. Connection *EXPRESSION (object:MQTTConnection)*

The name of the connection to the MQTT server.

##### A46.2.2. Topic *EXPRESSION (string)*

Topic to unsubscribe from.

#### General

##### A46.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A46.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A46.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

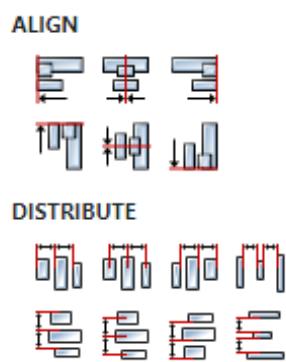

##### A46.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A46.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A46.3. Inputs

#### A46.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A46.4. Outputs

#### A46.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A46.5. Examples

- MQTT

## A47. NoOp

### A47.1. Description

This action does nothing, i.e. Flow execution continues through `seqout`.

### A47.2. Properties

#### Specific

##### A47.2.1. Name *String*

The name displayed in the component view within the Flow.

#### General

##### A47.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A47.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A47.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

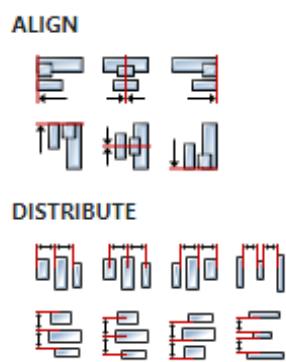

##### A47.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A47.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A47.3. Inputs

#### A47.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A47.4. Outputs

#### A47.4.1. seqout SEQ / OPTIONAL

A standard sequence output

## A48. OnEvent

### A48.1. Description

It is used to process events that can be broadcast within the page where the Action is located.

### A48.2. Properties

#### Specific

##### A48.2.1. Event *Enum*

Event to be processed. The following page events are available:

- `Page open` - emitted when the page becomes active, eg when it is displayed with the 'ShowPage' Action.
- `Page close` - emitted when the page becomes inactive.
- `Keypress` - emitted when a key on the keyboard is pressed. A string with keyboard name ([link](#)) is sent to the `event` output.

#### General

##### A48.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A48.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A48.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A48.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

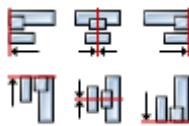

#### Position and size

##### A48.2.6. Align and distribute *Any*

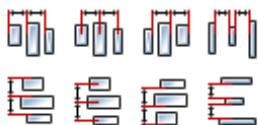

Alignment icons and component distribution. Alignment icons appear when two or more compo-

nents are selected, and distribution icons appear when three or more components are selected.

**ALIGN**

**DISTRIBUTE**

### A48.3. Outputs

#### A48.3.1. seqout    *SEQ / MANDATORY*

A standard sequence output. Flow execution continues through this output when the selected event is emitted.

#### A48.3.2. event    *DATA(any) / OPTIONAL*

Through this output, additional information (if any) is sent for the broadcast event. The `Page open` and `Page close` events do not send anything through this event, and the `Keystroke` event sends a string with key name ([link](#)).

### A48.4. Examples

- *Tetris*

## A49. Output

### A49.1. Description

Adds data output to a user action or user widget.

### A49.2. Properties

#### Specific

##### A49.2.1. Name *String*

Output name.

##### A49.2.2. Type *String*

Output data type.

#### General

##### A49.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A49.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A49.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

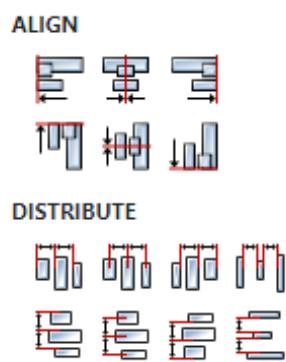

##### A49.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A49.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A49.3. Inputs

#### A49.3.1. seqin SEQ / MANDATORY

Data is received through this input, which is then forwarded to the caller of the user action.

## A50. OverrideStyle

### A50.1. Description

The action will replace one style with another style, so that all Widgets that use that style will use the new style after this replacement. This Action is used if you want to dynamically change the appearance of a Widget.

### A50.2. Properties

#### Specific

##### A50.2.1. From *ObjectReference*

The style to be replaced.

##### A50.2.2. To *ObjectReference*

A new style that will replace the existing one.

#### General

##### A50.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A50.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A50.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

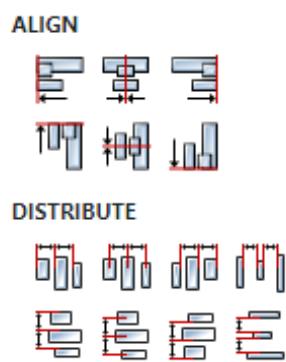

##### A50.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A50.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A50.3. Inputs

#### A50.3.1. seqin SEQ / OPTIONAL

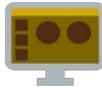

A standard sequence input.

### A50.4. Outputs

#### A50.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A51. PythonEnd

### A51.1. Description

Stops a running python script.

### A51.2. Properties

#### Specific

##### A51.2.1. Handle *EXPRESSION (integer)*

The handle obtained during the execution of *PythonRun* actions, and is used to determine which script we want to stop, since multiple scripts can be executed.

#### General

##### A51.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A51.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A51.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

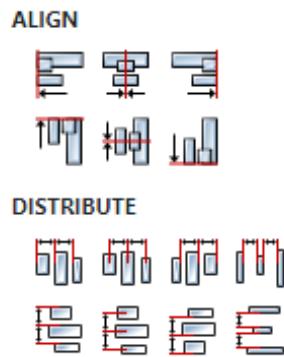

##### A51.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A51.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A51.3. Inputs

#### A51.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

#### A51.3.2. handle DATA(integer) / MANDATORY

The handle can also be passed through this input. If the handle is obtained in some other way, e.g. from a variable via the `Handle` property, then this input can be removed in the "Flow - Inputs" section.

### A51.4. Outputs

#### A51.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A52. PythonRun

### A52.1. Description

Runs a python script and sends the handle of the running script to the `handle` output. This handle is used in the `PythonEnd` Action if we want to stop a running Python script or in the `PythonSendMessage` Action if we want to send a message from Flow to a Python script, and it is needed because several scripts can be started at some point and the running script is determined through this handle.

### A52.2. Properties

#### Specific

##### A52.2.1. Script source option    *Enum*

The source of the python script can be specified in three ways:

- Inline script
- Inline script as expression
- Script file

##### A52.2.2. Inline script    *Python*

If `Inline script` was selected for `Script source option`, then the source code of the script should be entered here.

##### A52.2.3. Inline script as expression    *EXPRESSION (string)*

If `Inline script as expression` was selected for `Script source option`, then here you need to enter an expression that will return a string containing the source code of the script when evaluated.

##### A52.2.4. Script file    *EXPRESSION (string)*

If `Script file` was selected for `Script source option`, then the file path to the '.py' file should be entered here.

##### A52.2.5. Python path    *EXPRESSION (string)*

The full path to the python command. If the python command is already in the system path, then it can be set to an empty string, i.e. "".

#### General

##### A52.2.6. Description    *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A52.2.7. Inputs    *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check to*

check whether a data line that transmits data of that type is connected to the input or not.

#### A52.2.8. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

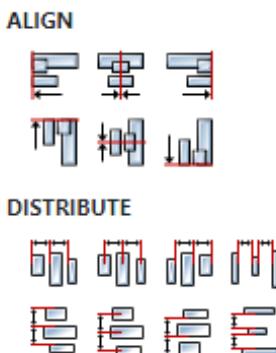

#### A52.2.9. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A52.2.10. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A52.3. Inputs

#### A52.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A52.4. Outputs

#### A52.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A52.4.2. handle DATA(integer) / OPTIONAL

Returns the handle of the running script used in *PythonEnd* and *PythonSendMessage* Actions.

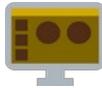

#### A52.4.3. message DATA(string) / OPTIONAL

Everything that is printed to `stdout` within the running Python script will be sent through this output. In this way, the python script sends a message to Flow, and if Flow wants to send a message to the Python script, then the *PythonSendMessage* Action should be used.

### A52.5. Examples

- *Charts*

## A53. PythonSendMessage

### A53.1. Description

Sends a message from Flow to a running Python script.

### A53.2. Properties

#### Specific

##### A53.2.1. Handle *EXPRESSION (integer)*

The handle obtained during the execution of the *PythonRun* action is used to determine which script we want to send the message to, since multiple scripts can be executed at the same time.

##### A53.2.2. Message *EXPRESSION (string)*

Message to be sent.

#### General

##### A53.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A53.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A53.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

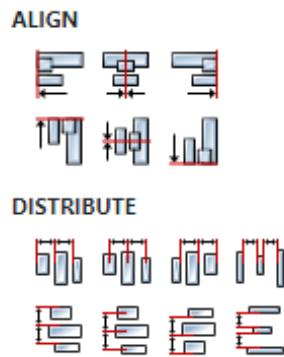

##### A53.2.6. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A53.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A53.3. Inputs

#### A53.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

#### A53.3.2. handle DATA(integer) / MANDATORY

The handle can also be passed through this input. If the handle is obtained in some other way, e.g. from a variable via the `Handle` property, then this input can be removed in the "Flow - Inputs" section.

### A53.4. Outputs

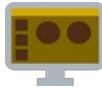

#### A53.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A53.5. Examples

- *Charts*

## A54. ReadSetting

### A54.1. Description

This action, for the defined key name, returns the saved value, or `null` if that key does not exist, from the `.eez-project-runtime-settings` file (it's the same file where persistent variables are saved).

NOTE: *WriteSetting* and *ReadSetting* Actions are used to save and retrieve from the `.eez-project-runtime-settings` file all those settings that we want to survive the *Dashboard* project restart. It is more convenient to use persistent variables, because in that case we do not have to execute a special Action for saving and

### A54.2. Properties

#### Specific

##### A54.2.1. Key *EXPRESSION (string)*

A string containing the name of the key whose value is to be retrieved.

#### General

##### A54.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A54.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A54.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

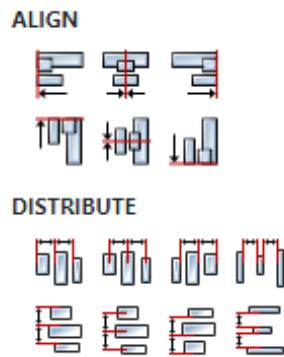

##### A54.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A54.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A54.3. Inputs

#### A54.3.1. seqin SEQ / MANDATORY

A standard sequence input.

### A54.4. Outputs

#### A54.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

#### A54.4.2. value DATA(any) / MANDATORY

The obtained `Value` of the defined `Key` is sent through this output.

## A55. Regexp

### A55.1. Description

Searches a set string or stream, using a pattern written according to the rules of the regular expression syntax.

### A55.2. Properties

#### Specific

##### A55.2.1. Pattern *EXPRESSION (string)*

Regular expression used for searching.

##### A55.2.2. Text *EXPRESSION (string)*

The text to be searched can be a string or a stream.

##### A55.2.3. Global *EXPRESSION (boolean)*

This option determines whether only the first occurrence of the pattern or every occurrence of the pattern is searched.

##### A55.2.4. Case insensitive *EXPRESSION (boolean)*

This option determines whether the search will be case sensitive or not.

#### General

##### A55.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A55.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A55.2.7. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A55.2.8. Catch error *Boolean*

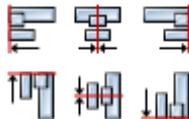

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

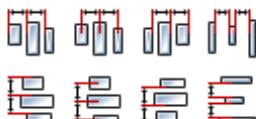

### A55.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### ALIGN

#### DISTRIBUTE

## A55.3. Inputs

### A55.3.1. seqin SEQ / OPTIONAL

A standard sequence input. This input needs to be used once at the beginning.

### A55.3.2. next SEQ / OPTIONAL

Use this input to get the next match.

### A55.3.3. stop SEQ / OPTIONAL

Use this input when we want to stop further searching, after which the Flow execution will immediately continue through the `done` output.

## A55.4. Outputs

### A55.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A55.4.2. match DATA(struct:\$RegExpResult) / MANDATORY

Search match in the form of `struct:$RegexpMatch` value is sent through this output. The `$RegexpMatch` structure has the following fields:

- `index` (integer) - The 0-based index of the match in the string.
- `texts` (array:string) - The array that has the matched text as the first item, and then one item for each capturing group ([link](#)) of the matched text.
- `indices` (array:array:integer) - It is an array where each entry represents the bounds of a substring match. The index of each element in this array corresponds to the index of the respective substring match in the `texts` array. In other words, the first `indices` entry represents the entire match, the second `indices` entry represents the first capturing group, etc. Each entry itself is a two-element array, where the first number represents the match's start index, and the second number, its end index.

### A1.1.1. done DATA(string) / OPTIONAL

Flow execution continues through this output when the search is complete, i.e. there are no more matches.

### A55.5. Examples

- *RegExp String*
- *RegExp Stream*

### A56.1. Description

Executes one or more SCPI commands or queries on the selected instrument. When all commands/queries are executed Flow execution continues through `seqout` output.

### A56.2. Properties

#### Specific

##### A56.2.1. Instrument *EXPRESSION (object:Instrument)*

Instrument object on which commands/queries are executed. This property is only present within the *Dashboard* project when the instrument is connected remotely, i.e. it is possible to have open connections to several instruments at the same time. If it is an *EEZ-GUI* project, then this property does not exist because we always use the device on which Flow is executed and we send SCPI commands to it.

##### A56.2.2. Scpi *TEMPLATE LITERAL*

List of SCPI commands/queries. Each command/query must be entered as a separate line. A Flow expression can also be inserted inside the command/query, which must be entered between two curly brackets. This is an example taken from the *BB3 Dashboard* example that uses a Flow expression within an SCPI command:

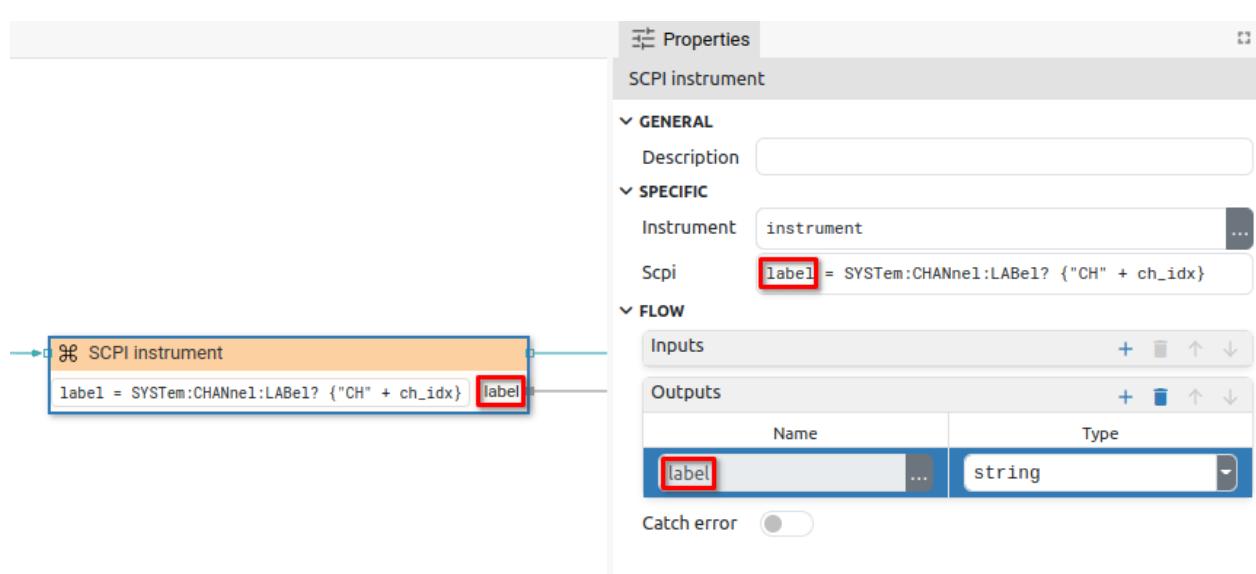

**A flow expression is inserted  
inside an SCPI command/query by  
entering it inside curly brackets.**

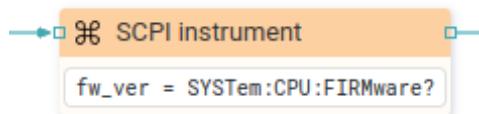

Also in the example above, a Flow `Catch Error` has been added to catch an error during the execution of the SCPI component.

For an SCPI query, it must be specified where the result is sent, and there we have two options:

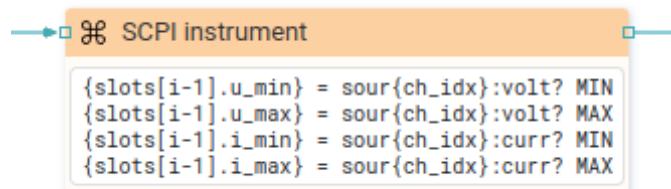

- Sending results to Flow output. It is necessary to add a new output using the "Flow - Outputs" section in the properties of this component, where it is necessary to write: `output_name=query?`. Here's an example, taken from the *BB3 Dashboard* example:

- Saving the result in a variable. The results are saved in a variable so that the query is written like this: `variable_name=query?` or `{assignable_expression}=query?`. This second form is used when it is stored, for example, in a structure member or an array. Here are examples for both forms, also taken from the *BB3 Dashboard* example:
- In this example, the result of the `SYSTem:CPU:FIRMware?` query is saved in the `fw_ver` variable. As it is the first (simple) form, then the name of the variable should not be enclosed in curly brackets.

- In this example, four SCPI queries are executed. The results are saved in the `slots` variable of the type: `array:struct:Slot`, where `slots` is a structure that has `u_min`, `u_max`, `i_min` and `i_max` members. The second form is used here and the assignable expression must be enclosed in curly brackets. Also here we have an example of using the expression `{ch_idx}` within the query itself.

#### A56.2.3. Timeout (ms)    *EXPRESSION (integer)*

The time in milliseconds to wait for the result of the query. If the result does not expire within that time, a Timeout error is generated, which can be handled through `@Error` output if `Catch error` is enabled. If set to 'null' then the timeout as specified in the Instrument Connect dialog is used.

#### A56.2.4. Delay (ms)    *EXPRESSION (integer)*

The minimum time specified in milliseconds that must elapse before a new SCPI command or query is sent. If set to 'null' then the delay as specified in the Instrument Connect dialog is used.

## General

### A56.2.5. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

## Flow

### A56.2.6. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### A56.2.7. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

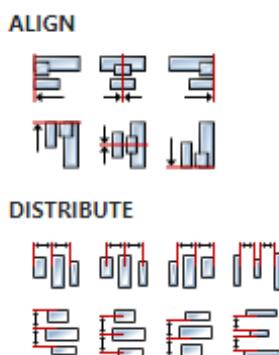

### A56.2.8. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A56.2.9. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A56.3. Inputs

### A56.3.1. seqin *SEQ / OPTIONAL*

A standard sequence input.

## A56.4. Outputs

### A56.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A56.5. Examples

- *BB3 Dashboard*
- *Plotly*
- *Rigol Waveform Data*
- *Screen Capture*

## A57. SelectInstrument

### A57.1. Description

Opens a dialog box for selecting an instrument. The selected instrument is sent to the `instrument` output.

It will not be necessary to use this Action if the global instrument object variable is set to `Persistent`, because the instrument selection dialog box will open immediately when the dashboard is started. However, if we don't want the instrument selection dialog box to open automatically at startup, then we must not enable the `Persistent` checkbox for the global instrument variable and we can use this Action later to select the desired instrument.

The screenshot shows the Project editor interface. On the left, the 'Variables' panel lists several variables: 'channels array:struct:Channel', 'CHUNK\_MAX\_POINTS integer', 'instrument object:Instrument' (which is highlighted in grey), 'instrumentProperties struct:InstrumentProperties', 'numDisplayedChannels integer', 'samplingRate integer', 'timeScale float', and 'view\_selected\_ch\_idx integer'. On the right, the 'Properties' panel shows the properties for the 'instrument' variable. The 'Name' is set to 'instrument', 'Type' is 'object:Instrument', and 'Default value' is 'null'. A red arrow points to the 'Persistent' checkbox, which is currently unchecked.

### A57.2. Properties

#### General

##### A57.2.1. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A57.2.2. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A57.2.3. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

##### A57.2.4. Catch error *Boolean*

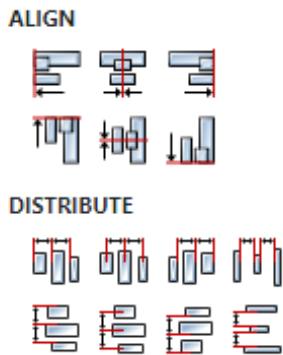

If this checkbox is enabled then an `@Error` output will be added to the component and if an error

occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## Position and size

### A57.2.5. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A57.3. Inputs

### A57.3.1. seqin SEQ / MANDATORY

A standard sequence input.

## A57.4. Outputs

### A57.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A57.4.2. instrument DATA(object:Instrument) / MANDATORY

The selected instrument is sent to this output.

## A58. SelectLanguage

### A58.1. Description

Changes the active language in multilanguage projects, i.e. projects that have the *Texts* feature added. After this, all texts on the page will be displayed in the newly selected language.

### A58.2. Properties

#### Specific

##### A58.2.1. Language *EXPRESSION (any)*

ID of the language that will become the new active language.

#### General

##### A58.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A58.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A58.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

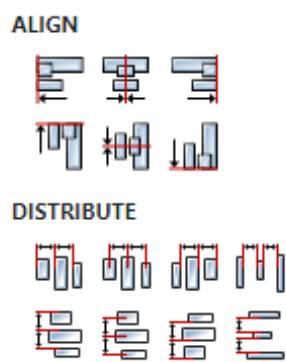

##### A58.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A58.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A58.3. Inputs

#### A58.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A58.4. Outputs

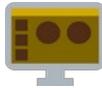

#### A58.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A58.5. Examples

- *Multi-Language*
- *Multi-Language Dashboard*

## A59. SerialConnect

### A59.1. Description

Makes a connection to the serial port. If the connection is successful, Flow execution continues through the `seqout` output, and if an error occurred, it can be caught if `Catch error` is enabled.

### A59.2. Properties

#### Specific

##### A59.2.1. Connection *EXPRESSION (object:SerialConnection)*

The name of the connection to be used for serial communication.

#### General

##### A59.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A59.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A59.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

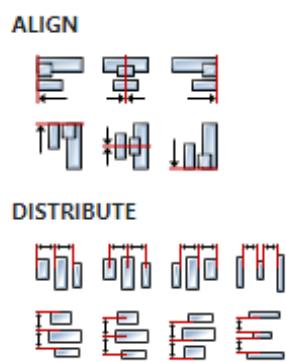

##### A59.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A59.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A59.3. Inputs

#### A59.3.1. seqin    *SEQ / OPTIONAL*

A standard sequence input.

### A59.4. Outputs

#### A59.4.1. seqout    *SEQ / OPTIONAL*

A standard sequence output.

### A59.5. Examples

- *SerialPort*

## A60. SerialDisconnect

### A60.1. Description

Performs disconnection from serial port, after which Flow execution continues through `seqout` output.

### A60.2. Properties

#### Specific

##### A60.2.1. Connection *EXPRESSION (object:SerialConnection)*

The name of the connection that will be terminated.

#### General

##### A60.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A60.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A60.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

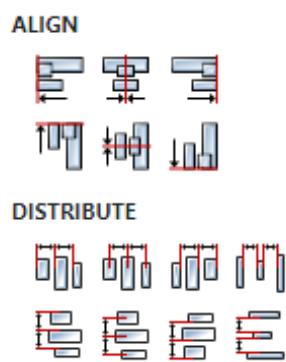

##### A60.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A60.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A60.3. Inputs

#### A60.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A60.4. Outputs

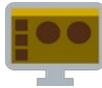

#### A60.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

### A60.5. Examples

- *SerialPort*

## A61. SerialInit

### A61.1. Description

Creates and initializes a Serial connection object with connection parameters that are defined through properties. This Action must be executed first, after which the *SerialConnect* Action must be called.

### A61.2. Properties

#### Specific

##### A61.2.1. Connection *ASSIGNABLE EXPRESSION (object:SerialConnection)*

Connection object of type `object:SerialConnection` to be created and initialized.

##### A61.2.2. Port *EXPRESSION (object:string)*

Serial port name.

##### A61.2.3. Baud rate *EXPRESSION (object:number)*

Serial port speed.

##### A61.2.4. Data bits *EXPRESSION (object:number)*

Serial port data bits. Allowed values are `5`, `6`, `7` or `8`.

##### A61.2.5. Stop bits *EXPRESSION (object:number)*

Serial port stop bits. Allowed values are `1` or `2`.

##### A61.2.6. Parity *EXPRESSION (object:string)*

Serial port parity. Allowed values are `"none"`, `"even"`, `"mark"`, `"odd"` or `"space"`

#### General

##### A61.2.7. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A61.2.8. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A61.2.9. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through

that output.

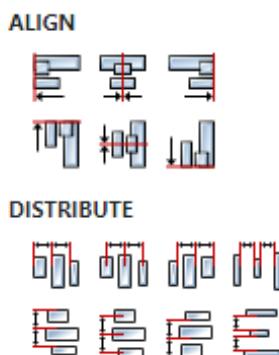

#### A61.2.10. Catch error   Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A61.2.11. Align and distribute   Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A61.3. Inputs

#### A61.3.1. seqin   SEQ / OPTIONAL

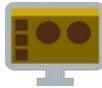

A standard sequence input.

### A61.4. Outputs

#### A61.4.1. seqout   SEQ / OPTIONAL

A standard sequence output.

## A62. SerialListPorts

### A62.1. Description

Retrieves the list of serial ports detected on the system and sends it through `ports` output.

### A62.2. Properties

#### General

##### A62.2.1. Description    String

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A62.2.2. Inputs    Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A62.2.3. Outputs    Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

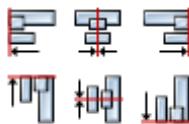

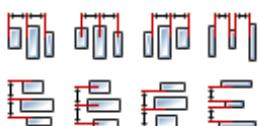

##### A62.2.4. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

**A62.2.5. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****A62.3. Inputs****A62.3.1. seqin SEQ / OPTIONAL**

A standard sequence input.

**A62.4. Outputs****A62.4.1. seqout SEQ / OPTIONAL**

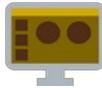

A standard sequence output.

**A62.4.2. ports DATA(array:struct:\$SerialPort) / MANDATORY**

A list of ports is sent to this output as a value of type `array:$SerialPort`. The system structure `$SerialPort` has these members:

- `manufacturer: string`. The name of the manufacturer of the device connected to the port.
- `serialNumber: string`. Port serial number.
- `path: string`. Path of the serial port, which is used in the *SerialInit* Action.

## A63. SerialRead

### A63.1. Description

Sends the read stream received via the selected serial connection to the `data` output.

### A63.2. Properties

#### Specific

##### A63.2.1. Connection *EXPRESSION (object:SerialConnection)*

The name of the serial connection.

#### General

##### A63.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A63.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A63.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

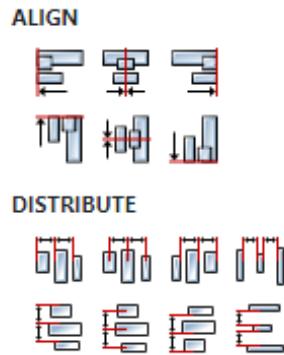

##### A63.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A63.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A63.3. Inputs

#### A63.3.1. seqin *SEQ / OPTIONAL*

A standard sequence input.

### A63.4. Outputs

#### A63.4.1. seqout *SEQ / OPTIONAL*

A standard sequence output.

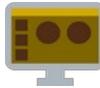

#### A63.4.2. data *DATA(string) / MANDATORY*

Output to which the read stream is sent.

### A63.5. Examples

- *SerialPort*

## A64. SerialWrite

### A64.1. Description

Sends a string to the serial port.

### A64.2. Properties

#### Specific

##### A64.2.1. Connection *EXPRESSION (object:SerialConnection)*

The name of the serial connection.

##### A64.2.2. Data *EXPRESSION (string)*

The string that is sent to the serial port.

#### General

##### A64.2.3. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A64.2.4. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A64.2.5. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

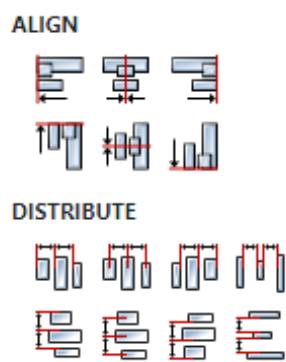

##### A64.2.6. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A64.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A64.3. Inputs

#### A64.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A64.4. Outputs

#### A64.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

### A64.5. Examples

- *SerialPort*

## A65. SetPageDirection

### A65.1. Description

It is used to change the page layout from LTR (left to right) to RTL (right to left) and vice versa.

### A65.2. Properties

#### Specific

##### A65.2.1. Direction *Enum*

Selected page layout: `LTR` or `RTL`.

#### General

##### A65.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A65.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A65.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

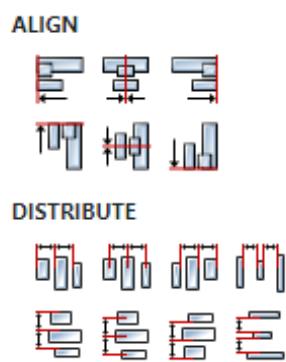

##### A65.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A65.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A65.3. Inputs

#### A65.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A65.4. Outputs

#### A65.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A66. SetVariable

### A66.1. Description

It is used to set a new value to one or more variables.

### A66.2. Properties

#### Specific

##### A66.2.1. Entries *Array*

List of variables to be set. Each element of the list contains a given variable name to which a new value is added, which is obtained by evaluating the given expression.

#### General

##### A66.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A66.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A66.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

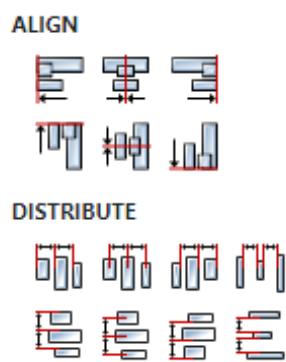

##### A66.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A66.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A66.3. Inputs

#### A66.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A66.4. Outputs

#### A66.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A67. ShowFileInFolder

### A67.1. Description

Displays the set file in the system file manager. When possible, the set file will also be selected.

### A67.2. Properties

#### Specific

##### A67.2.1. File path *EXPRESSION (string)*

Path to the file that will be displayed in the system file manager.

#### General

##### A67.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A67.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A67.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

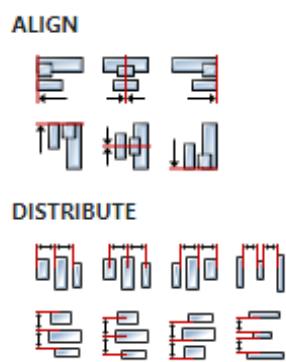

##### A67.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A67.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A67.3. Inputs

#### A67.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A67.4. Outputs

#### A67.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

### A67.5. Examples

- *Screen Capture*

## A68. ShowKeyboard

### A68.1. Description

Opens the keyboard page for text input. The keyboard page must be in the project and its ID must be 2. The keyboard page can also be opened with the *Input Widget*.

See in the *Keyboard, Keypad and Message Box* example how the keyboard page is defined:

### A68.2. Properties

#### Specific

##### A68.2.1. Label *EXPRESSION (string)*

The label that will be displayed on the keyboard page (e.g. the name of the parameter whose value is entered).

##### A68.2.2. Initial text *EXPRESSION (string)*

Initial (default) text that will be displayed in the input field.

##### A68.2.3. Min chars *EXPRESSION (integer)*

Defines the minimum length of the entered text.

##### A68.2.4. Max chars *EXPRESSION (integer)*

Defines the maximum length of the entered text.

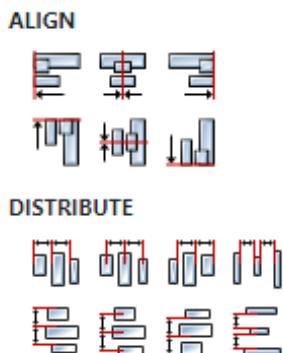

##### A68.2.5. Password *Boolean*

Used when entering hidden text such as a user's password. When it is enabled, every character will be replaced with \* when entered.

## Position and size

### A68.2.10. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

## A68.3. Inputs

### A68.3.1. seqin SEQ / MANDATORY

A standard sequence input.

## A68.4. Outputs

### A68.4.1. result DATA(string) / MANDATORY

Output to which the entered text is sent.

### A68.4.2. canceled DATA(null) / OPTIONAL

Flow execution continues through this output if the cancel button is pressed.

## A68.5. Examples

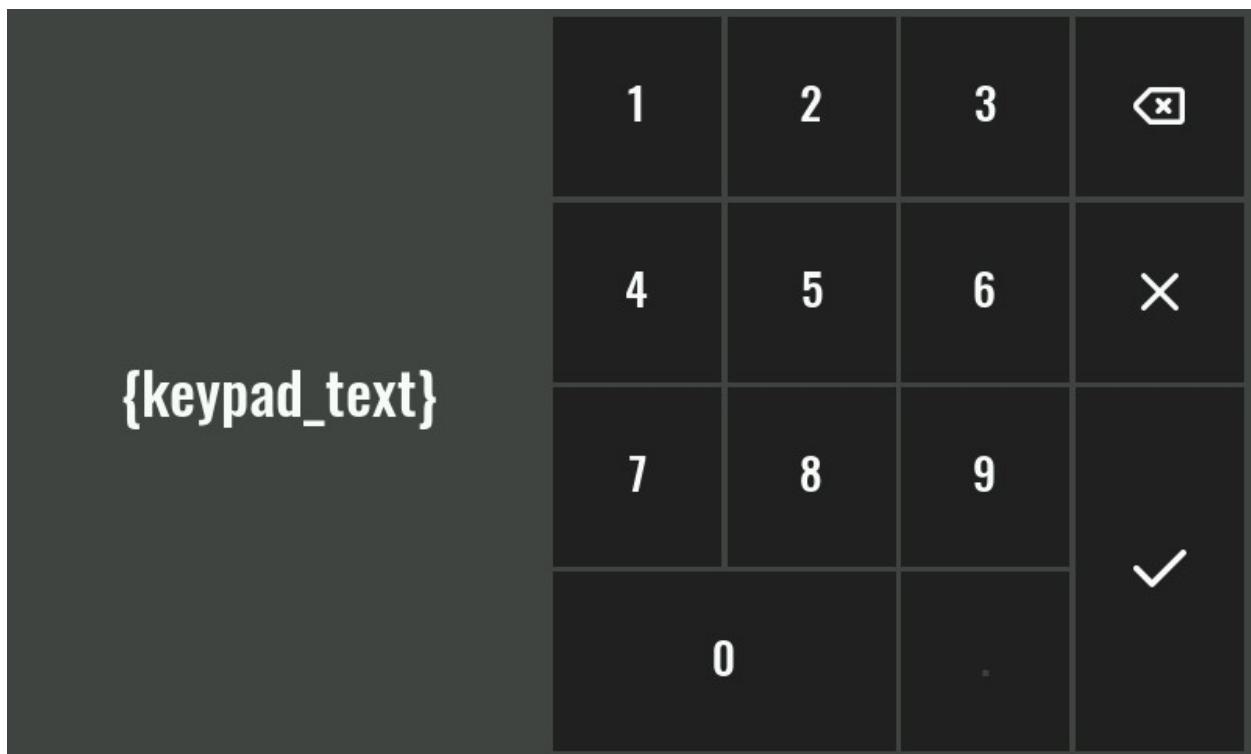

- *Keyboard, Keypad and Message Box*
- *stm32f469i-disco-eez-flow-demo*

## A69. ShowKeypad

### A69.1. Description

Opens the numeric keypad page for numerical input. The numeric keypad page must be in the project and its ID must be 3. The numeric keypad page can also be opened with the *Input Widget*. See in the *Keyboard, Keypad and Message Box* example how the numeric keypad page is defined:

### A69.2. Properties

#### Specific

##### A69.2.1. Label *EXPRESSION (string)*

The label that will be displayed on the keyboard page (e.g. the name of the parameter whose value is entered).

##### A69.2.2. Initial value *EXPRESSION (float)*

Initial (default) number that will be displayed in the input field.

##### A69.2.3. Min *EXPRESSION (integer)*

The entered number must be greater than or equal to this number.

##### A69.2.4. Max *EXPRESSION (integer)*

The entered number must be less than or equal to this number.

##### A69.2.5. Precision *EXPRESSION (float)*

Defines the rounding precision of the entered number. For example if a maximum of two decimal digits is desired, then `0.01` should be entered here.

### A69.3. Inputs

#### A69.3.1. seqin SEQ / MANDATORY

A standard sequence input.

### A69.4. Outputs

#### A69.4.1. result DATA(float) / MANDATORY

Output to which the entered numeric value is sent.

#### A69.4.2. canceled DATA(null) / OPTIONAL

Flow execution continues through this output if the cancel button is pressed.

### A69.5. Examples

- *stm32f469i-disco-eez-flow-demo*
- *eyboard, Keypad and Message Box*

## A70. ShowMessageBox

### A70.1. Description

This Action is used to display *Info*, *Error* or *Question* message boxes.

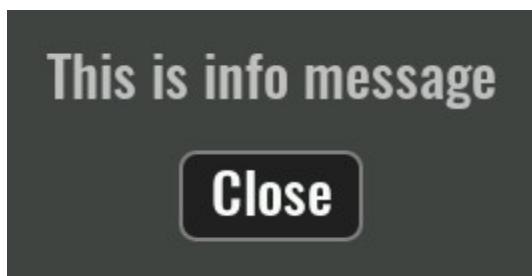

### A70.2. Properties

#### Specific

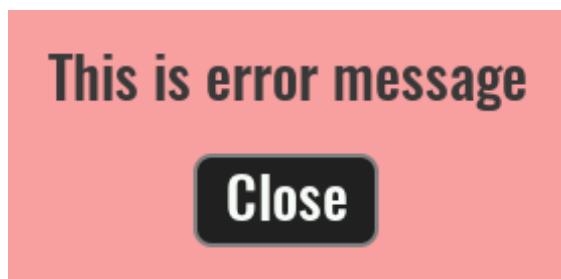

##### A70.2.1. Message type    *Enum*

Defines the message box that will be displayed:

- `Info`

- `Error`

- `Question`

##### A70.2.2. Message    *EXPRESSION (string)*

The content of the message to be displayed.

##### A70.2.3. Buttons    *EXPRESSION (array:string)*

This property needs to be defined only for the *Question* message box. An array of strings is expected here, where each string is mapped to a button, eg `["Save", "Don't Save", "Cancel"]`. It is necessary to add one output in the "Flow - Outputs" section for each button, through which the Flow execution will continue if that button is pressed.

## A70.4. Outputs

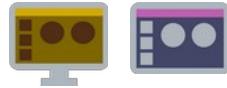

### A70.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A70.5. Examples

- *Keyboard, Keypad and Message Box*

## A71. ShowPage

### A71.1. Description

This Action sets a new active page: the previous page will be hidden and the new page will be displayed.

### A71.2. Properties

#### Specific

##### A71.2.1. Page *ObjectReference*

The name of the new page to be displayed.

#### General

##### A71.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A71.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A71.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the *Variable* property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

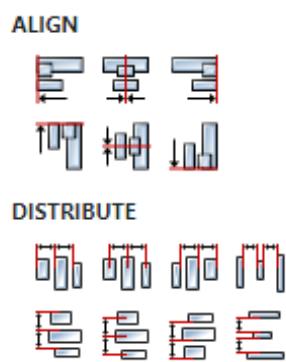

##### A71.2.5. Catch error *Boolean*

If this checkbox is enabled then an *@Error* output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A71.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A71.3. Inputs

#### A71.3.1. seqin SEQ / MANDATORY

A standard sequence input.

### A71.4. Outputs

#### A71.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A72. SortArray

### A72.1. Description

It sorts the array variable and returns the result through the data output: it does not do in-place sorting, i.e. it does not modify the content of the array variable. Allowed array types are:

- `array:integer`
- `array:float`
- `array:double`
- `array:struct`

If an array of type `array:struct` is sorted, then the `Structure name` and `Structure field name` by which it is sorted must also be specified.

There are also two options: whether Ascending/Descending sorting is desired and whether letter case is ignored if strings are sorted.

### A72.2. Properties

#### Specific

##### A72.2.1. Array *EXPRESSION (array:any)*

Array variable to be sorted.

##### A72.2.2. Structure name *ObjectReference*

Select the name of the structure here when the array is a variable of type `array:struct`.

##### A72.2.3. Structure field name *Enum*

Select the name of the field to be sorted by if the array is a variable of type `array:struct`.

##### A72.2.4. Ascending *Boolean*

Sorting mode selection (ascending if enabled, otherwise descending).

##### A72.2.5. Ignore case *Boolean*

Specifies whether letter case is ignored if strings are sorted or not.

#### General

##### A72.2.6. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A72.2.7. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A72.2.8. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

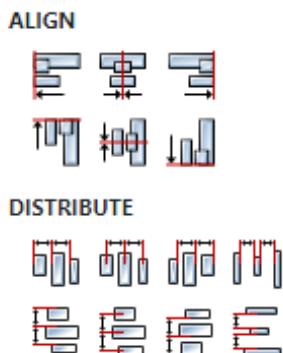

#### A72.2.9. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A72.2.10. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A72.3. Inputs

#### A72.3.1. seqin    SEQ / OPTIONAL

A standard sequence input.

### A72.4. Outputs

#### A72.4.1. seqout    SEQ / OPTIONAL

A standard sequence output.

#### A72.4.2. result    DATA(any) / MANDATORY

Output through which the sorted array is passed.

## A73. Start

### A73.1. Description

This action is executed first when Flow is started. Connect the output from this action to the first next action you want to perform.

### A73.2. Properties

#### General

##### A73.2.1. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A73.2.2. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A73.2.3. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

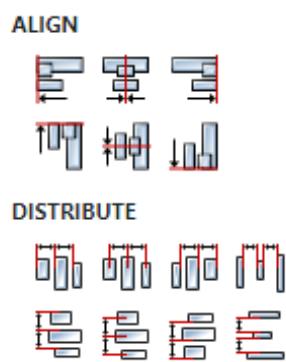

##### A73.2.4. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A73.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A73.3. Inputs

### A73.4. Outputs

#### A73.4.1. seqout SEQ / MANDATORY

Connect this output to the action you want to be executed first when the Flow starts.

## A74. SwitchCase

### A74.1. Description

The expressions added to the `Cases` list are evaluated one by one, starting from the first one in the list. The `Then output` of the first expression whose evaluation result will be `true` will be used for the output on which the Flow execution will continue. The value `true` will be passed to that output unless a `With value` expression is defined.

During Flow execution, it may happen that none of the specified cases in the list returns `true` during evaluation. To prevent this from happening and stop further execution of the Flow, a case can be added at the end of the list in which `true` will be entered in the `When` parameter so that the result of the evaluation will always be true and it will be possible to exit through its output.

### A74.2. Properties

#### Specific

##### A74.2.1. Cases *Array*

Each element of this list contains:

- `When` - an expression that is evaluated to see if it is `true`.
- `Then output` - the name of the output through which the execution of the Flow continues if the result of the evaluation of expression `When` is `true`.
- `With value` - optional parameter, if set as an expression, is passed to the output, if not defined `true` is passed.

#### General

##### A74.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A74.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A74.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

##### A74.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

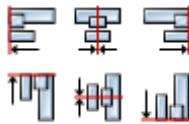

put. The data that will be passed through that output is the textual description of the error.

## Position and size

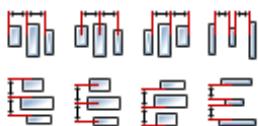

### A74.2.6. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

## A74.3. Inputs

### A74.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

## A74.4. Outputs

### A74.4.1. seqout SEQ / OPTIONAL

A standard sequence output.

## A75. TCPConnect

### A75.1. Description

Connects to the TCP server.

### A75.2. Properties

#### Specific

##### A75.2.1. Connection *ASSIGNABLE EXPRESSION (object:TCPConnection)*

Connection object of type `object:TCPConnection` to be created and initialized.

##### A75.2.2. IP Address *EXPRESSION (object:string)*

IP address of the server.

##### A75.2.3. Port *EXPRESSION (object:number)*

TCP port on which server accepts connections.

#### General

##### A75.2.4. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A75.2.5. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A75.2.6. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

##### A75.2.7. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

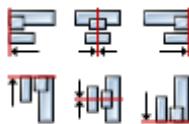

#### Position and size

##### A75.2.8. Align and distribute *Any*

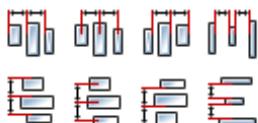

Alignment icons and component distribution. Alignment icons appear when two or more compo-

nents are selected, and distribution icons appear when three or more components are selected.

**ALIGN**

**DISTRIBUTE**

### A75.3. *Inputs*

#### A75.3.1. **seqin**    *SEQ / OPTIONAL*

A standard sequence input.

### A75.4. *Outputs*

#### A75.4.1. **seqout**    *SEQ / OPTIONAL*

A standard sequence output.

## A76. TCPDisconnect

### A76.1. Description

Performs disconnection from the TCP server, after which Flow execution continues through `seqout` output.

### A76.2. Properties

#### Specific

##### A76.2.1. Connection *EXPRESSION (object:TCPConnection)*

The name of the connection that will be terminated.

#### General

##### A76.2.2. Description *String*

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A76.2.3. Inputs *Array*

Additional component inputs that the user can add as desired in order to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

##### A76.2.4. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

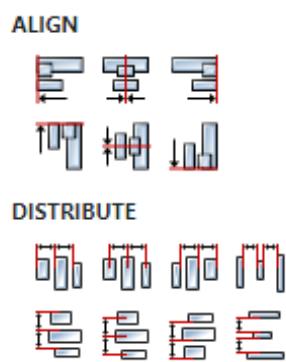

##### A76.2.5. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### Position and size

##### A76.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A76.3. Inputs

#### A76.3.1. seqin SEQ / OPTIONAL

A standard sequence input.

### A76.4. Outputs

#### A76.4.1. seqout SEQ / OPTIONAL

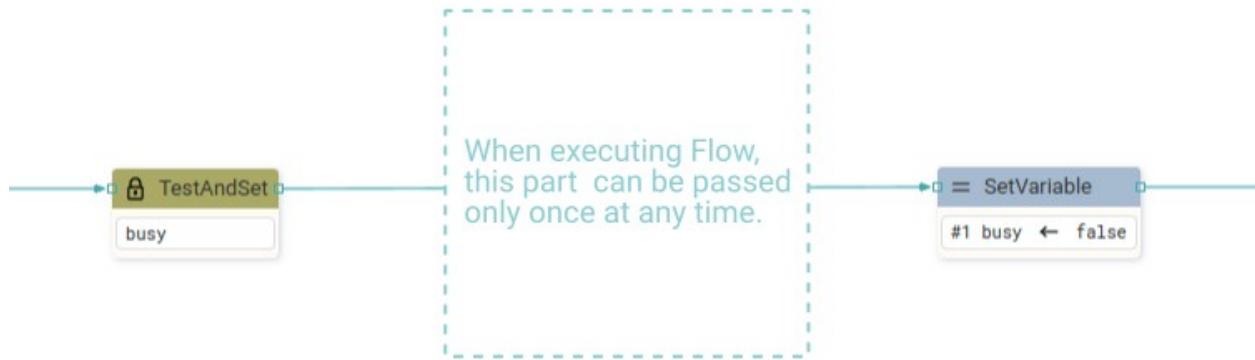

A standard sequence output.

## A77. TestAndSet

### A77.1. Description

It tests the `boolean` variable and if it is `false` then it is set to `true` and output to the sequential output (`seqout`), and if it is `true` then it is put back into the Flow execution queue, i.e. this action waits until the variable becomes `false`. This testing and setup is done as a single atomic (non-interruptable) operation, so this Action is suitable for the case when you want to make sure that at some point you only go through a certain part of the Flow once. In that case, this Action should be set before entering that part of the Flow, and at the exit from the Flow, the variable should be set to `false` again with the `SetVariable` Action.

### A77.2. Properties

#### Specific

##### A77.2.1. Variable `ASSIGNABLE EXPRESSION (boolean)`

The variable to be tested and set.

#### General

##### A77.2.2. Description `String`

This is the description of the Action component. Description is displayed below the component in the Project editor/viewer. In the main toolbar, it is possible to hide or display descriptions of all components with one click.

#### Flow

##### A77.2.3. Inputs `Array`

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

##### A77.2.4. Outputs `Array`

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the

output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

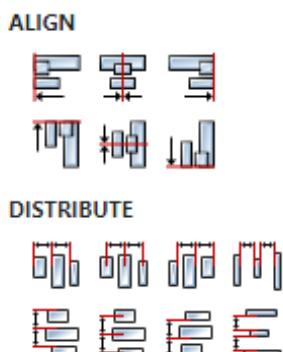

#### A77.2.5. Catch error    Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### Position and size

#### A77.2.6. Align and distribute    Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### A77.3. Inputs

#### A77.3.1. seqin    SEQ / OPTIONAL

A standard sequential input.

### A77.4. Outputs

#### A77.4.1. seqout    SEQ / OPTIONAL

Flow execution continues through this sequential output when the variable becomes `false`.

### A77.5. Examples

- *Tetris* In the `do_action` User action, which is called when it is detected that some key on the keyboard is pressed, the `TestAndSet` action on the `busy` variable is used at the beginning, and before the exit the `busy` variable is set to `false`. In this way, it is ensured that two Actions are not executed simultaneously.

# W1. Arc

## W1.1. Description

The Arc consists of a background and a foreground arc. The foreground (indicator) can be touch-adjusted.

More info ([link](#))

## W1.2. Properties

### Specific

#### W1.2.1. Range min *Number*

The minimum value that can be selected by the `Value` property.

#### W1.2.2. Range max *Number*

The maximum value that can be selected by the `Value` property.

#### W1.2.3. Value *EXPRESSION (integer)*

The value, in the range given by `Range min` and `Range max`, which sets the size of foreground (indicator) arc relative to the background arc.

#### W1.2.4. Value type *Enum*

Defines whether the `Value` will be given as a Literal or as an Expression.

#### W1.2.5. Bg start angle *Number*

Start angle of the background arc. Zero degrees is at the middle right (3 o'clock) of the object and the degrees are increasing in clockwise direction. The angles should be in the `[0, 360]` range.

#### W1.2.6. Bg end angle *Number*

End angle of the background arc. Zero degrees is at the middle right (3 o'clock) of the object and the degrees are increasing in clockwise direction. The angles should be in the `[0, 360]` range.

#### W1.2.7. Mode *Enum*

The arc can be one of the following modes:

- `NORMAL` – The indicator arc is drawn from the minimum value to the current.
- `REVERSE` – The indicator arc is drawn counter-clockwise from the maximum value to the current.
- `SYMMETRICAL` – The indicator arc is drawn from the middle point to the current value.

#### W1.2.8. Rotation *Number*

An offset to the 0 degree position.

### General

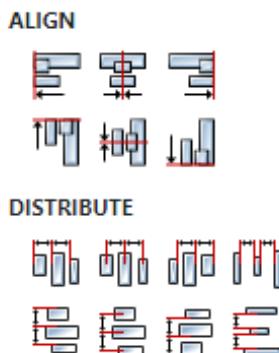

#### W1.2.9. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

## Position and size

### W1.2.10. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W1.2.11. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W1.2.12. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

### W1.2.13. Left unit Enum

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

### W1.2.14. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W1.2.15. Top unit Enum

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

### W1.2.16. Width Number

The width of the component. It is set in pixels.

### W1.2.17. Width unit Enum

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### W1.2.18. Height *Number*

The height of the component. It is set in pixels.

### W1.2.19. Height unit *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## Layout

### W1.2.20. Tab title *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W1.2.21. Use style *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

**W1.2.22. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W1.2.23. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W1.2.24. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W1.2.25. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W1.2.26. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W1.2.27. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W1.2.28. Scrollable** *Boolean*

Make the object scrollable.

**W1.2.29. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W1.2.30. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W1.2.31. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W1.2.32. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W1.2.33. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W1.2.34. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W1.2.35. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W1.2.36. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W1.2.37. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W1.2.38. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W1.2.39. Event bubble    Boolean**

Propagate the events to the parent too.

**W1.2.40. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W1.2.41. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W1.2.42. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W1.2.43. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W1.2.44. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

**States****W1.2.45. Checked    EXPRESSION (boolean)**

Toggled or checked state.

**W1.2.46. Checked state type    Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W1.2.47. Disabled    EXPRESSION (boolean)**

Disabled state

**W1.2.48. Disabled state type    Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W1.2.49. Focused    Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W1.2.50. Pressed    Boolean**

Being pressed.

**Events**

**W1.2.51. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W1.2.52. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W1.2.53. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W1.2.54. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W1.3. Examples**

- *LVGL Widgets Demo*
- *Smart Home*

## W2. Bar

### W2.1. Description

The bar object has a background and an indicator on it. The width of the indicator is set according to the current value of the bar.

Vertical bars can be created if the width of the object is smaller than its height.

Not only the end, but also the start value of the bar can be set, which changes the start position of the indicator.

More info ([link](#))

### W2.2. Properties

#### Specific

##### W2.2.1. Min Number

The minimum value that `Value` and `Value start` can contain.

##### W2.2.2. Max Number

The maximum value that `Value` and `Value start` can contain.

##### W2.2.3. Mode Enum

Bar mode options:

- `NORMAL` – A normal bar.
- `SYMMETRICAL` – Draw the indicator from the zero value to current value. Requires a negative minimum range and positive maximum range.
- `RANGE` – Allows setting the start value (`Value start` property) and end value (`Value` property).

##### W2.2.4. Value EXPRESSION (integer)

The end value on the bar.

##### W2.2.5. Value type Enum

Select between `Literal` and `Expression`. If `Expression` is selected then `Value` can be evaluated from the expression.

##### W2.2.6. Value start EXPRESSION (integer)

The start value on the bar if `RANGE` mode is selected.

##### W2.2.7. Value start type Enum

Select between `Literal` and `Expression`. If `Expression` is selected then `Value start` can be evaluated from the expression.

#### General

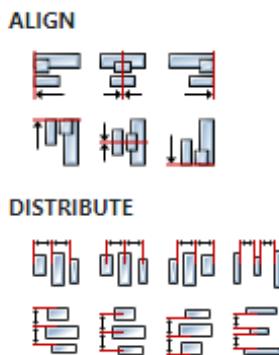

##### W2.2.8. Name String

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

## Position and size

### W2.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W2.2.10. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W2.2.11. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

### W2.2.12. Left unit Enum

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

### W2.2.13. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W2.2.14. Top unit Enum

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

### W2.2.15. Width Number

The width of the component. It is set in pixels.

### W2.2.16. Width unit Enum

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### W2.2.17. Height *Number*

The height of the component. It is set in pixels.

### W2.2.18. Height unit *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## Layout

### W2.2.19. Tab title *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W2.2.20. Use style *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

**W2.2.21. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W2.2.22. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W2.2.23. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W2.2.24. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W2.2.25. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W2.2.26. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W2.2.27. Scrollable** *Boolean*

Make the object scrollable.

**W2.2.28. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W2.2.29. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W2.2.30. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W2.2.31. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W2.2.32. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W2.2.33. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W2.2.34. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W2.2.35. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W2.2.36. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W2.2.37. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W2.2.38. Event bubble    Boolean**

Propagate the events to the parent too.

**W2.2.39. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W2.2.40. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W2.2.41. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W2.2.42. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W2.2.43. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

**States****W2.2.44. Checked    EXPRESSION (boolean)**

Toggled or checked state.

**W2.2.45. Checked state type    Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W2.2.46. Disabled    EXPRESSION (boolean)**

Disabled state

**W2.2.47. Disabled state type    Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W2.2.48. Focused    Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W2.2.49. Pressed    Boolean**

Being pressed.

**Events**

**W2.2.50. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W2.2.51. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W2.2.52. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W2.2.53. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W2.3. Examples**

- *Dashboard Widgets Demo*

## W3. BarGraph

### W3.1. Description

This Widget displays the default value through the `Data` property as a bar and as text (if selected). Also, if set, it will show two lines at the default positions (`Threshold1` and `Threshold2`), e.g. to mark some critical values.

### W3.2. Properties

#### Specific

##### W3.2.1. Data *EXPRESSION (any)*

This is the value within the range `[Min, Max]` for which the bar and text will be rendered.

##### W3.2.2. Orientation *Enum*

Defines the orientation of the Widget, the following options are available:

- `Left right` – as the value set through `Data` increases from Min to Max, the bar inside the graph also increases from the left side to the right side.
- `Right left` – the bar grows from right to left
- `Top bottom` – the bar grows from top to bottom
- `Bottom top` – the bar grows from bottom to top

##### W3.2.3. Display value *Boolean*

When checked, `Data` value will also be displayed as text.

##### W3.2.4. Threshold1 *EXPRESSION (any)*

An optional value within the range `[Min, Max]` at whose position a line will be drawn in the default style (`Threshold1`). It is used to mark some critical/important value within the bar graph.

##### W3.2.5. Threshold2 *EXPRESSION (any)*

An optional value within the range `[Min, Max]` at whose position a line will be drawn in the default style (`Threshold2`). It is used to mark some critical/important value within the bar graph.

##### W3.2.6. Min *EXPRESSION (any)*

The minimum value that `Data` can contain.

##### W3.2.7. Max *EXPRESSION (any)*

The maximum value that `Data` can contain.

##### W3.2.8. Refresh rate *EXPRESSION (any)*

Similar to the case of the `DisplayData` Widget, it defines the speed at which the text will be refreshed.

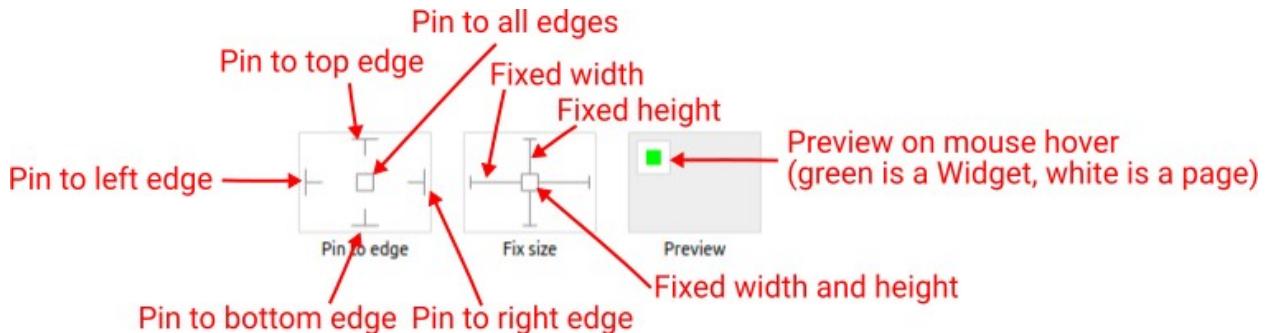

##### W3.2.9. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W3.2.10. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

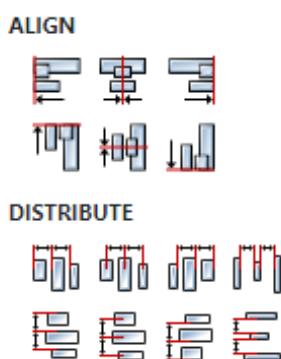

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W3.2.11. Hide "Widget is outside of its parent" warning Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W3.2.12. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W3.2.13. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W3.2.14. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W3.2.15. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W3.2.16. Width** *Number*

The width of the component. It is set in pixels.

**W3.2.17. Height** *Number*

The height of the component. It is set in pixels.

**W3.2.18. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W3.2.19. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W3.2.20. Default** *Object*

Style used when rendering of the Widget.

**W3.2.21. Text** *Object*

Style used to render the text inside the Widget.

**W3.2.22. Threshold1** *Object*

Style used to render the `Threshold1` value.

**W3.2.23. Threshold2** *Object*

Style used to render the `Threshold2` value.

**Events****W3.2.24. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.

- **Handler type** – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W3.2.25. Inputs `Array`

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W3.2.26. Outputs `Array`

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### W3.2.27. Catch error `Boolean`

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W3.3. Examples

- `eez-gui-widgets-demo`

## W4. Bitmap (Dashboard)

### W4.1. Description

This Widget displays a bitmap. If we know in advance which bitmap we want to display, then it is necessary to use the `Bitmap` property, where the selection is called the bitmap, and if the bitmap is known only during execution because, for example, it comes from some variable, then it is necessary to use the `Data` property.

### W4.2. Properties

#### Specific

##### W4.2.1. Data *EXPRESSION (any)*

There are several options for choosing which bitmap to display:

- If the default value is of type `integer` then it is the index of the bitmap to be displayed. It is necessary to use the functions `Flow.getBitmapIndex({<bitmapName>})`, which receives `bitmapName`, i.e. the name of the bitmap, and returns the index of the bitmap. In this way, we can choose or change which bitmap will be displayed in the runtime, because, for example, '`bitmapName`' can come from a variable.
- If the default value is of type `string` then it is assumed that the bitmap is encoded according to the Data URI Scheme ([link](#)) rules.
- If the default value is of type `blob` then the bitmap is defaulted to its binary notation (see *Screen Capture* example).

##### W4.2.2. Bitmap *ObjectReference*

The name of the bitmap to be displayed.

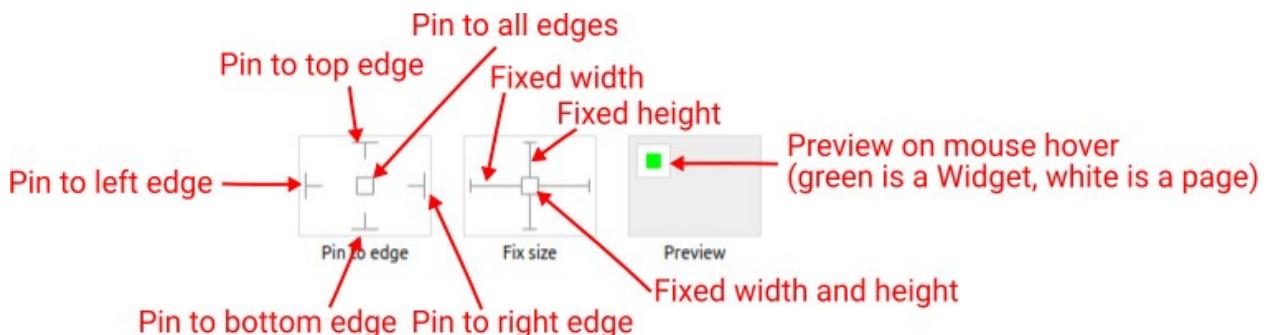

##### W4.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W4.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge

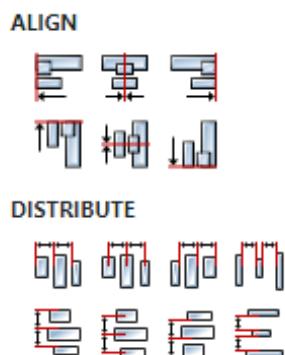

of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### **W4.2.5. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W4.2.6. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W4.2.7. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### **W4.2.8. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W4.2.9. Width Number**

The width of the component. It is set in pixels.

#### **W4.2.10. Height Number**

The height of the component. It is set in pixels.

#### **W4.2.11. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W4.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W4.2.13. Default** *Object*

Style used when rendering the background of the Widget.

**Events****W4.2.14. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W4.2.15. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W4.2.16. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W4.2.17. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W4.3. Examples**

- *Dashboard Widgets Demo*

- *Screen Capture*

## W5. Bitmap (EEZ-GUI)

### W5.1. Description

This Widget displays a bitmap.

### W5.2. Properties

#### Specific

##### W5.2.1. Data *EXPRESSION (integer)*

Index of the bitmap to be displayed. It is necessary to use the functions `Flow.getBitmapIndex({<bitmapName>})`, which receives `bitmapName`, i.e. the name of the bitmap, and returns the index of the bitmap. In this way, we can choose or change which bitmap will be displayed in the runtime, because, for example, '`bitmapName`' can come from a variable.

##### W5.2.2. Bitmap *ObjectReference*

The name of the bitmap to be displayed.

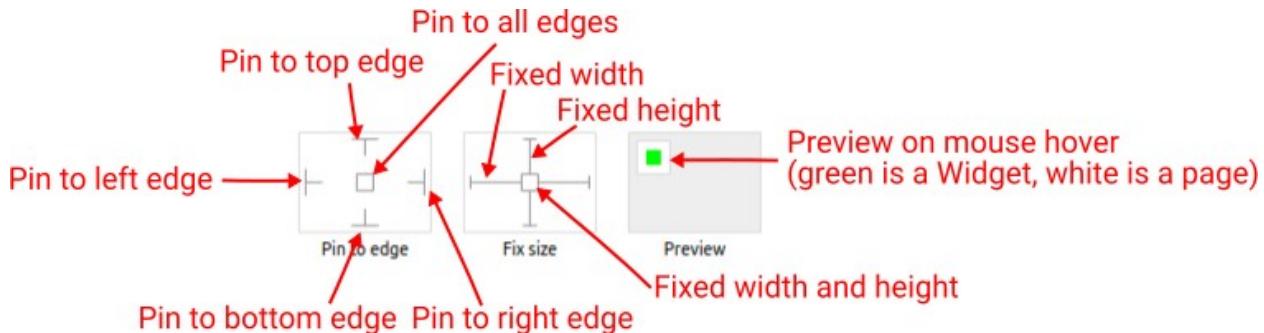

##### W5.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W5.2.4. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

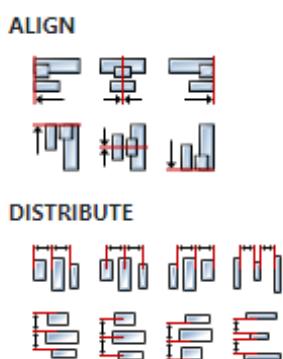

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W5.2.5. Hide "Widget is outside of its parent" warning Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W5.2.6. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W5.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W5.2.8. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W5.2.9. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W5.2.10. Width** *Number*

The width of the component. It is set in pixels.

**W5.2.11. Height** *Number*

The height of the component. It is set in pixels.

**W5.2.12. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W5.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W5.2.14. Default** *Object*

Style used when rendering the background of the Widget.

**Events****W5.2.15. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow**

### **W5.2.16. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### **W5.2.17. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W5.2.18. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W5.3. Examples**

- *eez-gui-widgets-demo*

## W6. Button (Dashboard)

### W6.1. Description

This Widget is used when an action needs to be performed via the GUI, clicking on it generates a `CLICKED` event, which in this case is added to the list of event handlers by default. The widget has two states enabled and disabled, which is set via the `Enabled` property. Each state has its own style, `Default` style for the enabled state and `Disabled` style for the disabled state.

### W6.2. Properties

#### Specific

##### W6.2.1. Label *EXPRESSION (any)*

The text that will be displayed inside the button.

##### W6.2.2. Enabled *EXPRESSION (any)*

If it is true, then the button is enabled, otherwise it will be disabled.

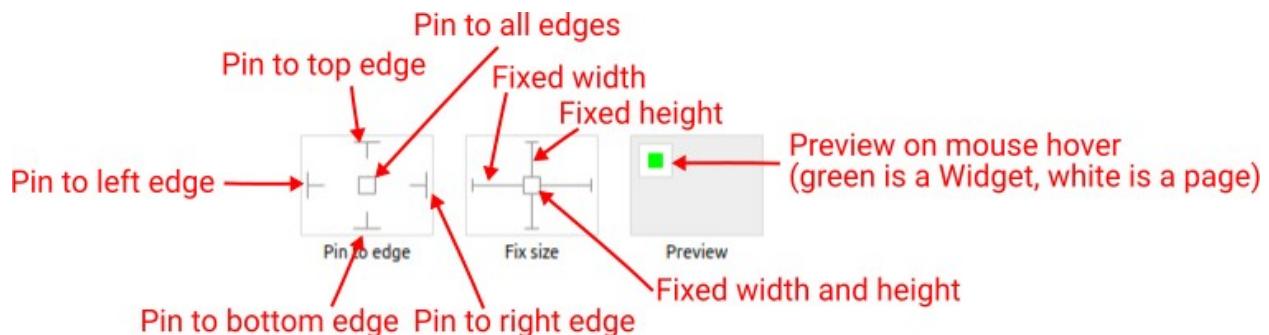

##### W6.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W6.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

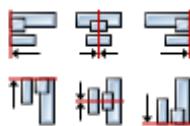

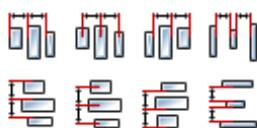

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W6.2.5. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W6.2.6. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W6.2.7. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W6.2.8. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W6.2.9. Width** *Number*

The width of the component. It is set in pixels.

**W6.2.10. Height** *Number*

The height of the component. It is set in pixels.

**W6.2.11. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W6.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style**

**W6.2.13. Default Object**

Style to be used for rendering if the Widget is enabled.

**W6.2.14. Disabled Object**

Style to be used for rendering if the Widget is disabled.

**Events****W6.2.15. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W6.2.16. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W6.2.17. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W6.2.18. Catch error Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W6.3. Examples**

- [eez-gui-widgets-demo](#)

## W7. Button (EEZ-GUI)

### W7.1. Description

This Widget is used when an action needs to be performed via the GUI, clicking on it generates a `CLICKED` event, which in this case is added to the list of event handlers by default. The widget has two states enabled and disabled, which is set via the `Enabled` property. Each state has its own style, `Default` style for the enabled state and `Disabled` style for the disabled state.

### W7.2. Properties

#### Specific

##### W7.2.1. Label *EXPRESSION (any)*

The text that will be displayed inside the button.

##### W7.2.2. Enabled *EXPRESSION (any)*

If it is true, then the button is enabled, otherwise it will be eisabled.

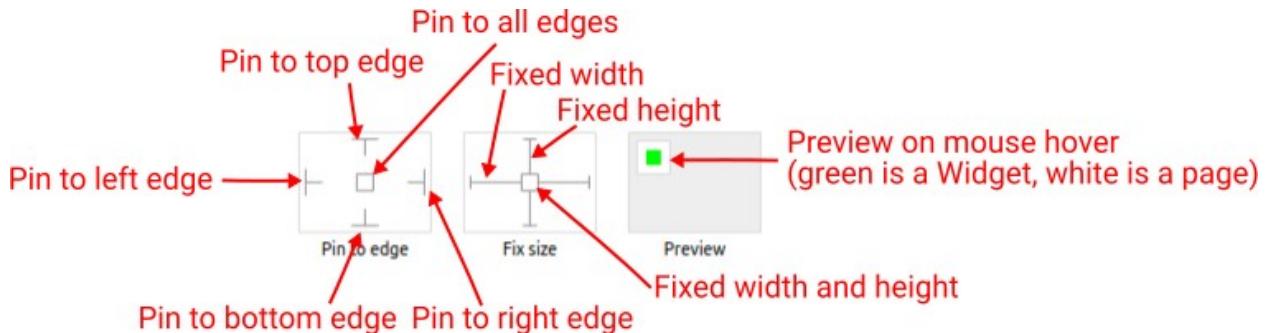

##### W7.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W7.2.4. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

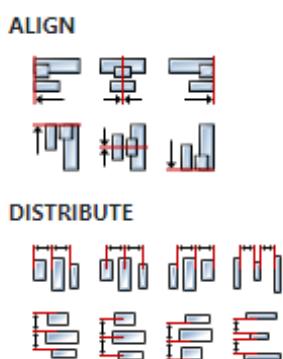

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W7.2.5. Hide "Widget is outside of its parent" warning Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W7.2.6. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W7.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W7.2.8. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W7.2.9. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W7.2.10. Width** *Number*

The width of the component. It is set in pixels.

**W7.2.11. Height** *Number*

The height of the component. It is set in pixels.

**W7.2.12. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W7.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W7.2.14. Default** *Object*

Style to be used for rendering if the Widget is enabled.

**W7.2.15. Disabled** *Object*

Style to be used for rendering if the Widget is disabled.

**Events****W7.2.16. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W7.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W7.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### W7.2.19. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W7.3. Examples

- `eez-gui-widgets-demo`

## W8. ButtonGroup

### W8.1. Description

Shows a group of buttons. The total number of buttons and their labels are defined with `Button labels`. Only one of those buttons can be selected, which is defined by the `Selected button` item. If the button is selected, then `Selected` style is used, otherwise `Default` style is used when rendering an individual button.

### W8.2. Properties

#### Specific

##### W8.2.1. Button labels *EXPRESSION (any)*

Specifies the labels of all buttons. The number of elements in this string array defines how many buttons will be displayed.

##### W8.2.2. Selected button *EXPRESSION (any)*

Determines which button is selected. It is a zero-based integer, which means that if its value is 0, the first button will be selected, if its value is 1, the second button will be selected, etc. If we want no button to be selected, we will use the value -1.

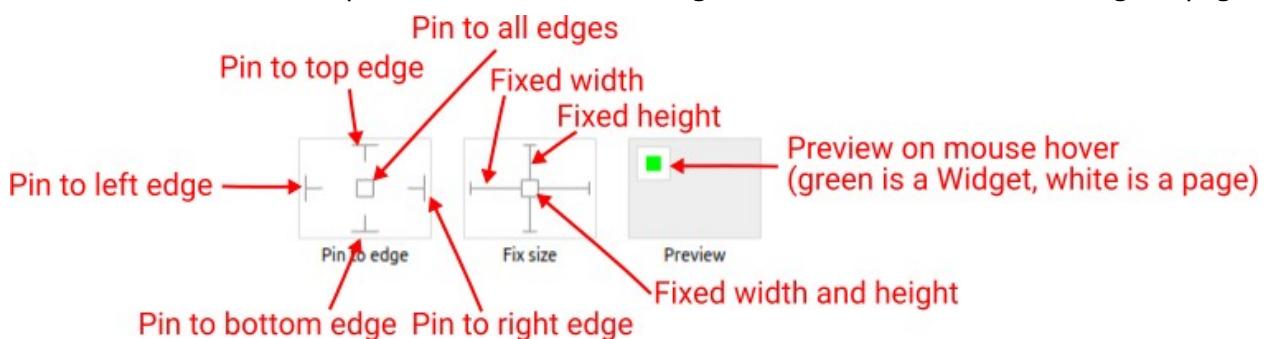

##### W8.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W8.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge*.

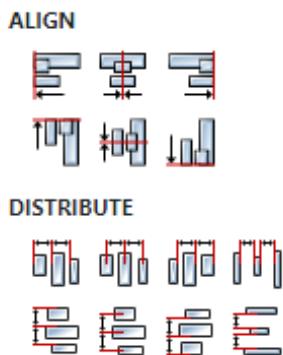

and *Fix width*.

### **W8.2.5. Hide "Widget is outside of its parent" warning    Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

### **W8.2.6. Align and distribute    Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### **W8.2.7. Center widget    Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### **W8.2.8. Left    Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W8.2.9. Top    Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W8.2.10. Width    Number**

The width of the component. It is set in pixels.

### **W8.2.11. Height    Number**

The height of the component. It is set in pixels.

### **W8.2.12. Absolute position    String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

### **W8.2.13. Tab title    EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W8.2.14. Default Object

Style is used to render a button that is not selected.

### W8.2.15. Selected Object

Style used to render the selected button.

## Events

### W8.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W8.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W8.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### W8.2.19. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W8.3. Examples

- [eez-gui-widgets-demo](#)

## W9. Button (LVGL)

### W9.1. Description

This Widget is used when an action needs to be performed via the GUI, clicking on it generates a `CLICKED` event.

More info ([link](#))

### W9.2. Properties

#### General

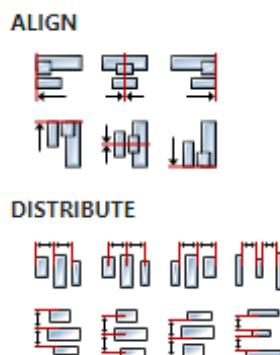

##### W9.2.1. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W9.2.2. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W9.2.3. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

##### W9.2.4. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

##### W9.2.5. Left unit *Enum*

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

#### **W9.2.6. Top    *Number***

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W9.2.7. Top unit    *Enum***

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

#### **W9.2.8. Width    *Number***

The width of the component. It is set in pixels.

#### **W9.2.9. Width unit    *Enum***

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

#### **W9.2.10. Height    *Number***

The height of the component. It is set in pixels.

#### **W9.2.11. Height unit    *Enum***

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

### **Layout**

#### **W9.2.12. Tab title    *EXPRESSION (string)***

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

### **Style**

#### **W9.2.13. Use style    *ObjectReference***

Here we can select one of the globally defined Styles so that the Widget uses that Style.

### **Flags**

#### **W9.2.14. Hidden    *EXPRESSION (boolean)***

Make the object hidden.

#### **W9.2.15. Hidden flag type    *Enum***

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

#### **W9.2.16. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

#### **W9.2.17. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

#### **W9.2.18. Click focusable** *Boolean*

Add focused state to the object when clicked.

#### **W9.2.19. Checkable** *Boolean*

Toggle checked state when the object is clicked.

#### **W9.2.20. Scrollable** *Boolean*

Make the object scrollable.

#### **W9.2.21. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

#### **W9.2.22. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

#### **W9.2.23. Scroll one** *Boolean*

Allow scrolling only one snappable children.

#### **W9.2.24. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

#### **W9.2.25. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

#### **W9.2.26. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

#### **W9.2.27. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

#### **W9.2.28. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

#### **W9.2.29. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

#### **W9.2.30. Press lock** *Boolean*

Keep the object pressed even if the press slid from the object.

#### **W9.2.31. Event bubble** *Boolean*

Propagate the events to the parent too.

#### **W9.2.32. Gesture bubble    Boolean**

Propagate the gestures to the parent.

#### **W9.2.33. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

#### **W9.2.34. Ignore layout    Boolean**

Make the object positionable by the layouts.

#### **W9.2.35. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

#### **W9.2.36. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

## **States**

#### **W9.2.37. Checked    EXPRESSION (boolean)**

Toggled or checked state.

#### **W9.2.38. Checked state type    Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W9.2.39. Disabled    EXPRESSION (boolean)**

Disabled state

#### **W9.2.40. Disabled state type    Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W9.2.41. Focused    Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W9.2.42. Pressed    Boolean**

Being pressed.

## **Events**

#### **W9.2.43. Event handlers    Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.

- Action - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W9.2.44. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W9.2.45. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W9.2.46. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W9.3. Examples

- LVGL Widgets Demo

# W10. Calendar

## W10.1. Description

This Widget displays a calendar.  
More info ([link](#))

## W10.2. Properties

### Specific

#### W10.2.1. Year *Number*

Initially selected year.

#### W10.2.2. Month *Number*

Initially selected month.

#### W10.2.3. Day *Number*

Initially selected day.

### General

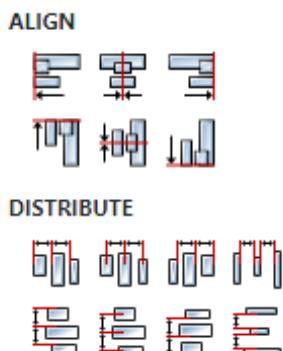

#### W10.2.4. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

### Position and size

#### W10.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### W10.2.6. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W10.2.7. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W10.2.8. Left unit** *Enum*

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

**W10.2.9. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W10.2.10. Top unit** *Enum*

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

**W10.2.11. Width** *Number*

The width of the component. It is set in pixels.

**W10.2.12. Width unit** *Enum*

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

**W10.2.13. Height** *Number*

The height of the component. It is set in pixels.

**W10.2.14. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W10.2.15. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style**

**W10.2.16. Use style    ObjectReference**

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W10.2.17. Hidden    EXPRESSION (boolean)**

Make the object hidden.

**W10.2.18. Hidden flag type    Enum**

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W10.2.19. Clickable    EXPRESSION (boolean)**

Make the object clickable by input devices.

**W10.2.20. Clickable flag type    Enum**

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W10.2.21. Click focusable    Boolean**

Add focused state to the object when clicked.

**W10.2.22. Checkable    Boolean**

Toggle checked state when the object is clicked.

**W10.2.23. Scrollable    Boolean**

Make the object scrollable.

**W10.2.24. Scroll elastic    Boolean**

Allow scrolling inside but with slower speed.

**W10.2.25. Scroll momentum    Boolean**

Make the object scroll further when "thrown".

**W10.2.26. Scroll one    Boolean**

Allow scrolling only one snappable children.

**W10.2.27. Scroll chain hor    Boolean**

Allow propagating the horizontal scroll to a parent.

**W10.2.28. Scroll chain ver    Boolean**

Allow propagating the vertical scroll to a parent.

**W10.2.29. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W10.2.30. Scroll on focus    Boolean**

Automatically scroll object to make it visible when focused.

**W10.2.31. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W10.2.32. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W10.2.33. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W10.2.34. Event bubble Boolean**

Propagate the events to the parent too.

**W10.2.35. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W10.2.36. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W10.2.37. Ignore layout Boolean**

Make the object positionable by the layouts.

**W10.2.38. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W10.2.39. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W10.2.40. Checked EXPRESSION (boolean)**

Toggled or checked state.

**W10.2.41. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W10.2.42. Disabled EXPRESSION (boolean)**

Disabled state

**W10.2.43. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W10.2.44. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W10.2.45. Pressed Boolean**

Being pressed.

## Events

### W10.2.46. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W10.2.47. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W10.2.48. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### W10.2.49. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W10.3. Examples

- *LVGL Widgets Demo*

# W11. Chart

## W11.1. Description

Charts are a basic object to visualize data points.  
More info ([link](#))

## W11.2. Properties

### General

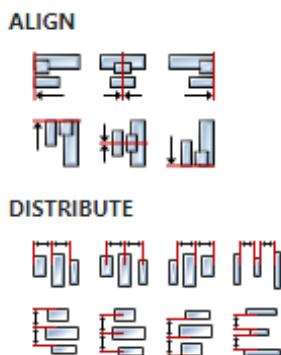

#### W11.2.1. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

### Position and size

#### W11.2.2. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### W11.2.3. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### W11.2.4. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### W11.2.5. Left unit *Enum*

The following options are available:

- `px` – Left is default in pixels.

- `%` – Left is set as a percentage in relation to the parent width.

### **W11.2.6. Top *Number***

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W11.2.7. Top unit *Enum***

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

### **W11.2.8. Width *Number***

The width of the component. It is set in pixels.

### **W11.2.9. Width unit *Enum***

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### **W11.2.10. Height *Number***

The height of the component. It is set in pixels.

### **W11.2.11. Height unit *Enum***

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## Layout

### **W11.2.12. Tab title *EXPRESSION (string)***

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### **W11.2.13. Use style *ObjectReference***

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

### **W11.2.14. Hidden *EXPRESSION (boolean)***

Make the object hidden.

### **W11.2.15. Hidden flag type *Enum***

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W11.2.16. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W11.2.17. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W11.2.18. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W11.2.19. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W11.2.20. Scrollable** *Boolean*

Make the object scrollable.

**W11.2.21. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W11.2.22. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W11.2.23. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W11.2.24. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W11.2.25. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W11.2.26. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W11.2.27. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W11.2.28. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W11.2.29. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W11.2.30. Press lock** *Boolean*

Keep the object pressed even if the press slid from the object.

**W11.2.31. Event bubble** *Boolean*

Propagate the events to the parent too.

**W11.2.32. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W11.2.33. Adv hit test Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W11.2.34. Ignore layout Boolean**

Make the object positionable by the layouts.

**W11.2.35. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W11.2.36. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W11.2.37. Checked EXPRESSION (boolean)**

Toggled or checked state.

**W11.2.38. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W11.2.39. Disabled EXPRESSION (boolean)**

Disabled state

**W11.2.40. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W11.2.41. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W11.2.42. Pressed Boolean**

Being pressed.

**Events****W11.2.43. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.

- Action - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W11.2.44. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W11.2.45. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

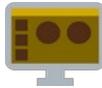

### W11.2.46. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W11.3. Examples

- Dashboard Widgets Demo

## W12. Checkbox (Dashboard)

### W12.1. Description

Checkbox Widget is used when we want a turn ON or turn OFF option.

### W12.2. Properties

#### Specific

##### W12.2.1. Value *EXPRESSION (any)*

Boolean variable in which `true` is stored when the switch is ON and `false` when the switch is OFF.

##### W12.2.2. Label *EXPRESSION (string)*

Label displayed next to the checkbox.

##### W12.2.3. Enabled *EXPRESSION (any)*

If it is true, then the checkbox is enabled, otherwise it will be disabled.

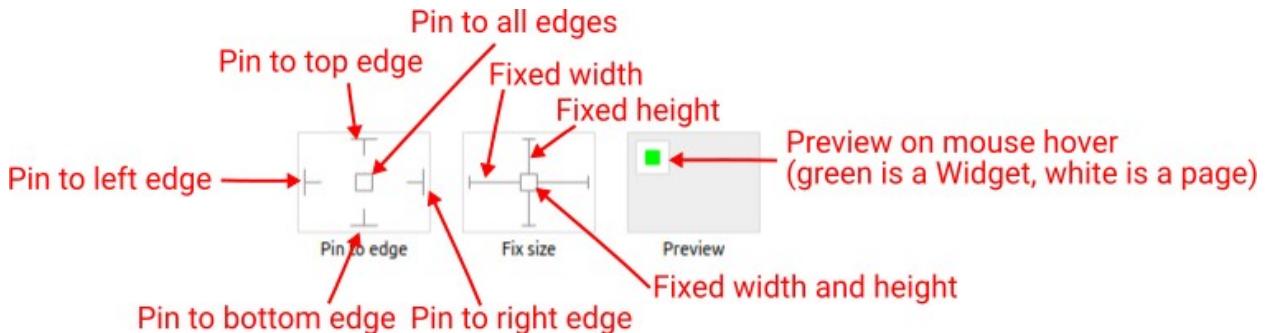

##### W12.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W12.2.5. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

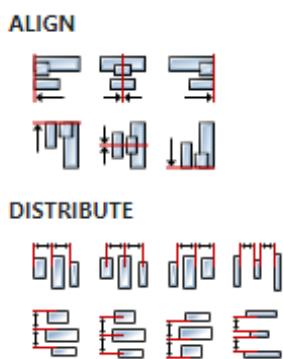

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W12.2.6. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W12.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W12.2.8. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), sim-

ple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W12.2.9. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W12.2.10. Width Number**

The width of the component. It is set in pixels.

### **W12.2.11. Height Number**

The height of the component. It is set in pixels.

### **W12.2.12. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

### **W12.2.13. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## **Style**

### **W12.2.14. Default Object**

Style used when rendering of the Widget.

## **Events**

### **W12.2.15. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## **Flow**

### **W12.2.16. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to

check whether a data line that transmits data of that type is connected to the input or not.

#### **W12.2.17. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### **W12.2.18. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W12.3. Examples**

- *Dashboard Widgets Demo*

## W13. Checkbox (LVGL)

### W13.1. Description

Checkbox Widget is used when we want a turn ON or turn OFF option.  
More info ([link](#))

### W13.2. Properties

#### Specific

##### W13.2.1. Text *String*

Label displayed next to the checkbox.

#### General

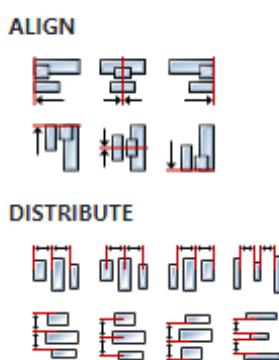

##### W13.2.2. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W13.2.3. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W13.2.4. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

##### W13.2.5. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*`

and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W13.2.6. Left unit    *Enum***

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

### **W13.2.7. Top    *Number***

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W13.2.8. Top unit    *Enum***

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

### **W13.2.9. Width    *Number***

The width of the component. It is set in pixels.

### **W13.2.10. Width unit    *Enum***

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### **W13.2.11. Height    *Number***

The height of the component. It is set in pixels.

### **W13.2.12. Height unit    *Enum***

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## **Layout**

### **W13.2.13. Tab title    *EXPRESSION (string)***

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## **Style**

### **W13.2.14. Use style    *ObjectReference***

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## **Flags**

**W13.2.15. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W13.2.16. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W13.2.17. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W13.2.18. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W13.2.19. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W13.2.20. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W13.2.21. Scrollable** *Boolean*

Make the object scrollable.

**W13.2.22. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W13.2.23. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W13.2.24. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W13.2.25. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W13.2.26. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W13.2.27. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W13.2.28. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W13.2.29. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W13.2.30. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W13.2.31. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W13.2.32. Event bubble    Boolean**

Propagate the events to the parent too.

**W13.2.33. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W13.2.34. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W13.2.35. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W13.2.36. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W13.2.37. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

## States

**W13.2.38. Checked    EXPRESSION (boolean)**

Toggled or checked state.

**W13.2.39. Checked state type    Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W13.2.40. Disabled    EXPRESSION (boolean)**

Disabled state

**W13.2.41. Disabled state type    Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W13.2.42. Focused    Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W13.2.43. Pressed    Boolean**

Being pressed.

## Events

#### **W13.2.44. Event handlers    Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

#### **Flow**

#### **W13.2.45. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W13.2.46. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W13.2.47. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W13.3. Examples**

- *Dashboard Widgets Demo*

## W14. Colorwheel

### W14.1. Description

This widget allows the user to select a color.  
More info ([link](#))

### W14.2. Properties

#### Specific

##### W14.2.1. Mode *Enum*

Select which part of the color will be changed with the Widget:

- HUE
- SATURATION
- VALUE

##### W14.2.2. Fixed mode *Boolean*

The color mode can be fixed (so as to not change with long press) using this item.

#### General

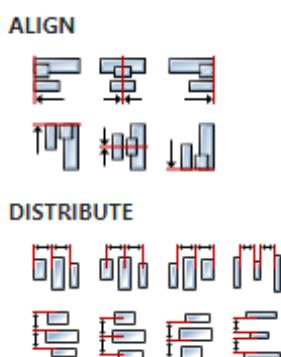

##### W14.2.3. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W14.2.4. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W14.2.5. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W14.2.6. Left    Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2`.

#### **W14.2.7. Left unit    Enum**

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

#### **W14.2.8. Top    Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W14.2.9. Top unit    Enum**

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

#### **W14.2.10. Width    Number**

The width of the component. It is set in pixels.

#### **W14.2.11. Width unit    Enum**

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

#### **W14.2.12. Height    Number**

The height of the component. It is set in pixels.

#### **W14.2.13. Height unit    Enum**

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## **Layout**

#### **W14.2.14. Tab title    EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### **W14.2.15. Use style    ObjectReference**

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

### **W14.2.16. Hidden    EXPRESSION (boolean)**

Make the object hidden.

### **W14.2.17. Hidden flag type    Enum**

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

### **W14.2.18. Clickable    EXPRESSION (boolean)**

Make the object clickable by input devices.

### **W14.2.19. Clickable flag type    Enum**

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

### **W14.2.20. Click focusable    Boolean**

Add focused state to the object when clicked.

### **W14.2.21. Checkable    Boolean**

Toggle checked state when the object is clicked.

### **W14.2.22. Scrollable    Boolean**

Make the object scrollable.

### **W14.2.23. Scroll elastic    Boolean**

Allow scrolling inside but with slower speed.

### **W14.2.24. Scroll momentum    Boolean**

Make the object scroll further when "thrown".

### **W14.2.25. Scroll one    Boolean**

Allow scrolling only one snappable children.

### **W14.2.26. Scroll chain hor    Boolean**

Allow propagating the horizontal scroll to a parent.

### **W14.2.27. Scroll chain ver    Boolean**

Allow propagating the vertical scroll to a parent.

### **W14.2.28. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W14.2.29. Scroll on focus    Boolean**

Automatically scroll object to make it visible when focused.

**W14.2.30. Scroll with arrow    Boolean**

Allow scrolling the focused object with arrow keys.

**W14.2.31. Snappable    Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W14.2.32. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W14.2.33. Event bubble    Boolean**

Propagate the events to the parent too.

**W14.2.34. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W14.2.35. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W14.2.36. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W14.2.37. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W14.2.38. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

**States**

**W14.2.39. Checked** *EXPRESSION (boolean)*

Toggled or checked state.

**W14.2.40. Checked state type** *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W14.2.41. Disabled** *EXPRESSION (boolean)*

Disabled state

**W14.2.42. Disabled state type** *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W14.2.43. Focused** *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

**W14.2.44. Pressed** *Boolean*

Being pressed.

**Events****W14.2.45. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W14.2.46. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W14.2.47. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

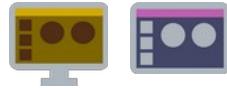

**W14.2.48. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W14.3. Examples**

- *Dashboard Widgets Demo*

## W15. Container

### W15.1. Description

It is used to group several Widgets, and it is used when we want to additionally organize a page that contains a large number of Widgets or if we want to perform some operation on several Widgets at once, e.g. hide using the `Visible` property of the Container. When the Widget is inside the Container, then its left and top coordinates are relative to the left and top of the Container, which means that when the Container is moved, all the Widgets inside it are also moved. Widgets are added to the Container via the *Widgets Structure* panel using drag and drop.

### W15.2. Properties

#### Specific

##### W15.2.1. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Layout

##### W15.2.2. Layout *Enum*

Determines how Child widgets are positioned within this container:

- `Static` – Child widgets are positioned within the Container using their left and top properties.
- `Horizontal` – Child widgets are positioned from left to right (or vice versa if RTL is selected in the `SetPageDirection` action) and in order according to the order set through the *Widgets Structure* panel. So, if this option is selected, then the left property of the Child widget is not used. If a Child widget is hidden, then it is skipped and its position is taken by the next visible Widget in the list.
- `Vertical` – Child widgets are positioned from top to bottom and in order according to the order set through the *Widgets Structure* panel. So, if this option is selected, then the top property of the Child widget is not used. If a Child widget is hidden, then it is skipped and its position is taken by the next visible Widget from the list.
- `Docking Manager` – Each child widget is located inside separate tab and these tabs can be arranged within container boundaries in an arbitrary way. For example, they can be grouped inside tab strips or docked at any position inside container. This options is only available for Dashboard projects.

##### W15.2.3. Edit layout *Any*

If `Layout` property is set to `Docking Manager` then this button opens the editor for configuring initial position of tabs within container. Please note, user can later change the layout configuration when dashboard is running. User changes are saved in `.eez-project-runtime-settings` file, created at the same location where the `.eez-project` file is.

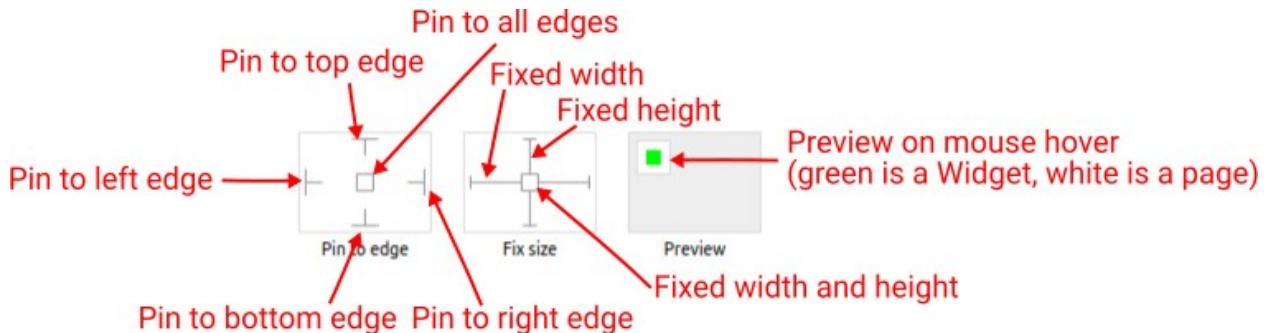

##### W15.2.4. Tab title *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

#### Position and size

**W15.2.5. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

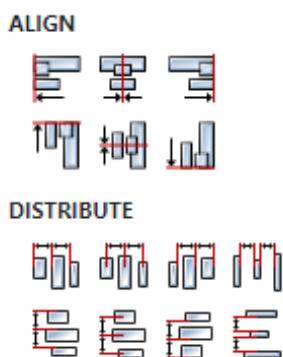

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W15.2.6. Hide "Widget is outside of its parent" warning Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W15.2.7. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W15.2.8. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W15.2.9. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W15.2.10. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W15.2.11. Width** *Number*

The width of the component. It is set in pixels.

**W15.2.12. Height** *Number*

The height of the component. It is set in pixels.

**W15.2.13. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**General****W15.2.14. Name** *String*

Optional name to display in the *Widgets Structure* panel in the editor. If not set then `Container` is displayed.

**Style****W15.2.15. Default** *Object*

Style used when rendering the background of the Widget.

**Events****W15.2.16. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow**

### **W15.2.17. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### **W15.2.18. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W15.2.19. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W15.3. Examples**

- `eez-gui-widgets-demo`

## W16. DisplayData

### W16.1. Description

Similar to the `Text` Widget, but it has some more options that are set via the `Display option` and `Refresh rate` properties.

### W16.2. Properties

#### Specific

##### W16.2.1. Data `EXPRESSION (any)`

An expression that, when calculated, is converted into a string and displayed inside the widget.

##### W16.2.2. Display option `Enum`

If the calculated `Data` is a floating point number, then with this property we can choose which part of the floating point number is displayed:

- `All` – displays the entire floating point number
- `Integer` – displays only the whole part (integer) of the number
- `Fraction` – displays only decimals (fractions) of a number

##### W16.2.3. Refresh rate `EXPRESSION (any)`

This property defines how often the content of this widget will be refreshed. It is set in milliseconds. If the `Data` changes with a high frequency and if the content of this widget is renewed with that frequency (e.g. if the Refresh rate is set to 0) then it will be a problem to see that content, therefore it is recommended to increase the Refresh rate, e.g. at 200 ms.

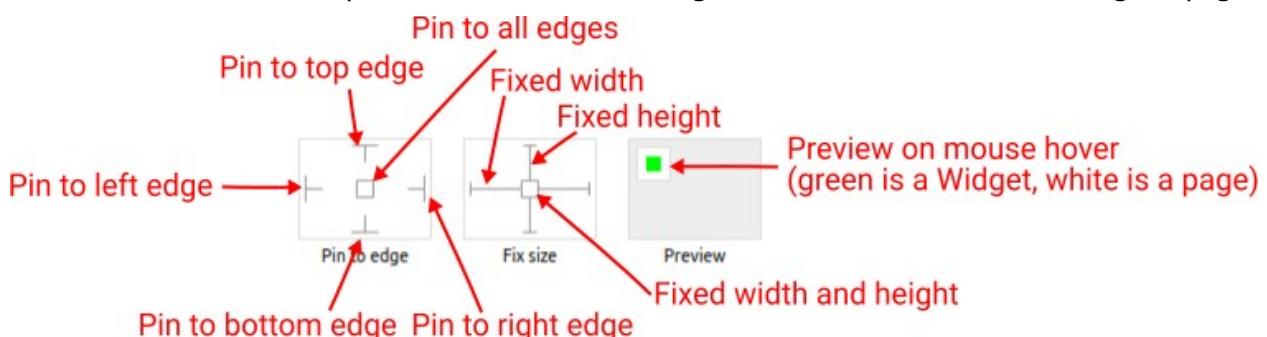

##### W16.2.4. Visible `EXPRESSION (boolean)`

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W16.2.5. Resizing `Any`

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the `Pin to edge` option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the `Scale to fit` option is selected. E.g. if we selected `Pin to top edge` then the distance between the top edge of the page and the top edge

of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

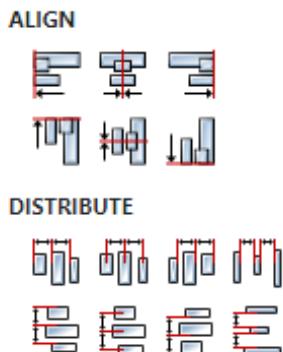

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### **W16.2.6. Hide "Widget is outside of its parent" warning   Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

#### **W16.2.7. Align and distribute   Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W16.2.8. Center widget   Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W16.2.9. Left   Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the *Top*, *Width* and *Height* properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use *+*, *-*, *\** and */* operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

#### **W16.2.10. Top   Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W16.2.11. Width   Number**

The width of the component. It is set in pixels.

#### **W16.2.12. Height   Number**

The height of the component. It is set in pixels.

**W16.2.13. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W16.2.14. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W16.2.15. Default** *Object*

Style used when rendering of the Widget.

**W16.2.16. Focused** *Object*

Style to be used for rendering if the Widget is in focus.

**Events****W16.2.17. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W16.2.18. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W16.2.19. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

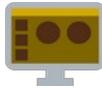

**W16.2.20. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### ***W16.3. Examples***

- *eez-gui-widgets-demo*

## W17. Dropdown (Dashboard)

### W17.1. Description

We can use this widget when we need to select one option from the list.

### W17.2. Properties

#### Specific

##### W17.2.1. Data *EXPRESSION (integer)*

The variable in which the zero-based index of the selected option will be stored.

##### W17.2.2. Options *EXPRESSION (any)*

List of options.

##### W17.2.3. Enabled *EXPRESSION (any)*

If it is true, then the dropdown is enabled, otherwise it will be disabled.

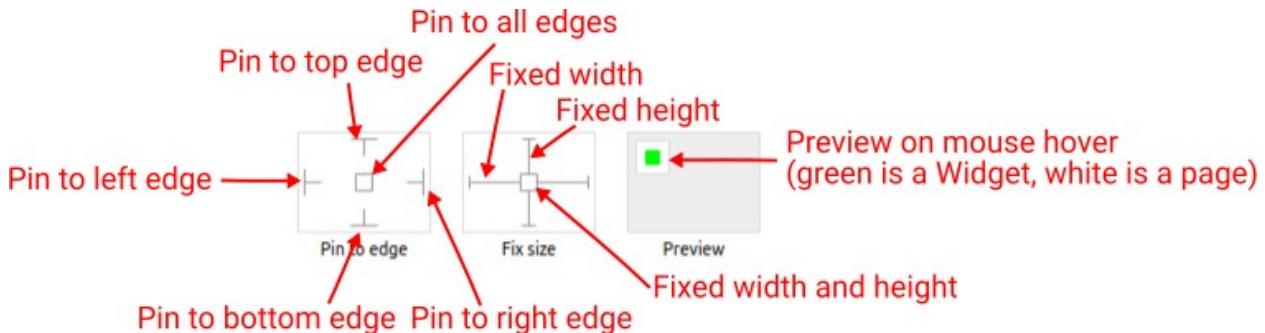

##### W17.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W17.2.5. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

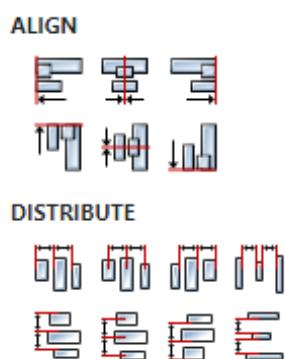

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W17.2.6. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W17.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W17.2.8. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), sim-

ple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W17.2.9. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W17.2.10. Width Number**

The width of the component. It is set in pixels.

### **W17.2.11. Height Number**

The height of the component. It is set in pixels.

### **W17.2.12. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

### **W17.2.13. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## **Style**

### **W17.2.14. Default Object**

Style used when rendering of the Widget.

## **Events**

### **W17.2.15. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## **Flow**

### **W17.2.16. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to

check whether a data line that transmits data of that type is connected to the input or not.

#### **W17.2.17. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### **W17.2.18. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W17.3. Examples**

- *Dashboard Widgets Demo*

## W18. Dropdown (EEZ-GUI)

### W18.1. Description

We can use this widget when we need to select one option from the list.

### W18.2. Properties

#### Specific

##### W18.2.1. Data *EXPRESSION (integer)*

The variable in which the zero-based index of the selected option will be stored.

##### W18.2.2. Options *EXPRESSION (any)*

List of options.

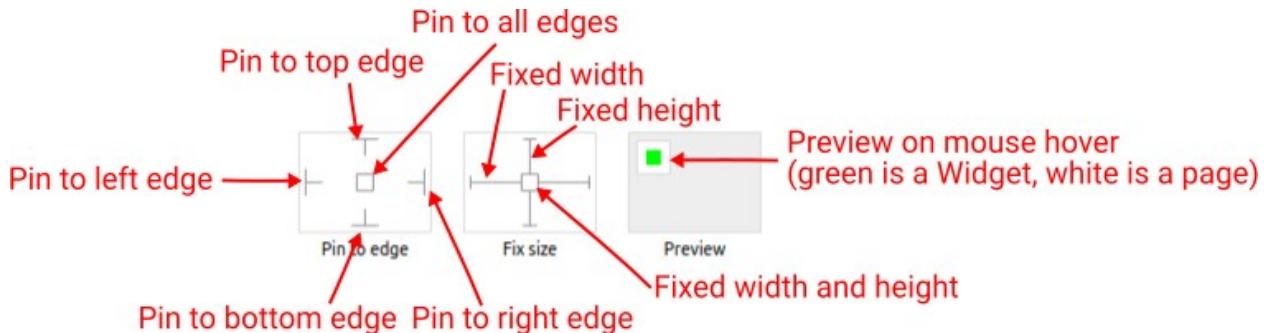

##### W18.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

**W18.2.4. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

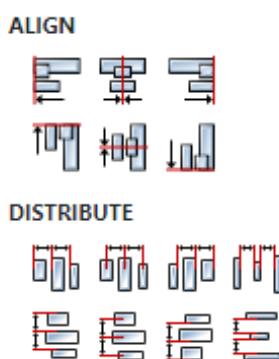

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W18.2.5. Hide "Widget is outside of its parent" warning Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W18.2.6. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W18.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W18.2.8. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W18.2.9. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W18.2.10. Width** *Number*

The width of the component. It is set in pixels.

**W18.2.11. Height** *Number*

The height of the component. It is set in pixels.

**W18.2.12. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W18.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W18.2.14. Default** *Object*

Style used when rendering of the Widget.

**Events****W18.2.15. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow**

### **W18.2.16. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### **W18.2.17. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W18.2.18. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W18.3. Examples**

- `eez-gui-widgets-demo`

## W19. Dropdown (LVGL)

### W19.1. Description

The drop-down list allows the user to select one value from a list.  
More info ([link](#))

### W19.2. Properties

#### Specific

##### W19.2.1. Options *EXPRESSION (array:string)*

List of options.

##### W19.2.2. Options type *Enum*

Select between Literal and Expression. If Literal is selected then Options are entered one option per line. If Expression is selected then options are evaluated from Options expression which must be of type array:string.

##### W19.2.3. Selected *EXPRESSION (integer)*

The zero-based index of the selected option.

##### W19.2.4. Selected type *Enum*

Select between Literal and Assignable. If Assignable is selected then Options can be variable in which the zero-based index of the selected option will be stored.

#### General

##### W19.2.5. Name *String*

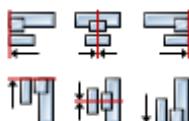

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

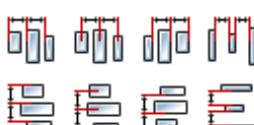

##### W19.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

###### ALIGN

###### DISTRIBUTE

**W19.2.7. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W19.2.8. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W19.2.9. Left unit** *Enum*

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

**W19.2.10. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W19.2.11. Top unit** *Enum*

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

**W19.2.12. Width** *Number*

The width of the component. It is set in pixels.

**W19.2.13. Width unit** *Enum*

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

**W19.2.14. Height** *Number*

The height of the component. It is set in pixels.

**W19.2.15. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**W19.2.16. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W19.2.17. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W19.2.18. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W19.2.19. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W19.2.20. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W19.2.21. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W19.2.22. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W19.2.23. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W19.2.24. Scrollable** *Boolean*

Make the object scrollable.

**W19.2.25. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W19.2.26. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W19.2.27. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W19.2.28. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W19.2.29. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W19.2.30. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W19.2.31. Scroll on focus    Boolean**

Automatically scroll object to make it visible when focused.

**W19.2.32. Scroll with arrow    Boolean**

Allow scrolling the focused object with arrow keys.

**W19.2.33. Snappable    Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W19.2.34. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W19.2.35. Event bubble    Boolean**

Propagate the events to the parent too.

**W19.2.36. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W19.2.37. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W19.2.38. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W19.2.39. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W19.2.40. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

**States**

**W19.2.41. Checked** *EXPRESSION (boolean)*

Toggled or checked state.

**W19.2.42. Checked state type** *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W19.2.43. Disabled** *EXPRESSION (boolean)*

Disabled state

**W19.2.44. Disabled state type** *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W19.2.45. Focused** *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

**W19.2.46. Pressed** *Boolean*

Being pressed.

**Events****W19.2.47. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W19.2.48. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W19.2.49. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

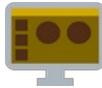

**W19.2.50. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W19.3. Examples**

- *Dashboard Widgets Demo*

## W20. EEZChart

### W20.1. Description

Displays a line chart using the same Widget as in the Instrument *History* panel.

### W20.2. Properties

#### Specific

##### W20.2.1. Chart mode *Enum*

The following modes are available:

- Single chart – Displays a single chart.
- Multiple charts – Displays multiple charts.
- EEZ DLOG – Displays the chart given by the EEZ DLOG file format.
- Instrument History Item – Displays a chart from the instrument history.

##### W20.2.2. Chart data *EXPRESSION (any)*

If `Chart mode` is set to `Single chart`, then a string, array or blob containing the samples that will be displayed in the chart should be set here. If `Chart mode` is set to `EEZ DLOG` then the content of the EEZ DLOG file should be set here (e.g. it can be read with `FileRead` Action, see *EEZ Chart example*).

This property is not used when the `Chart mode` is `Multiple charts` or `Instrument History item`.

##### W20.2.3. Format *EXPRESSION (string)*

Format of `Data` property. Possible values:

- "float" – "Chart data" must be a blob containing 32-bit, little-endian float numbers, or `array:float`
- "double" – "Chart data" must be a blob containing 64-bit, little-endian float numbers, or `array:float`
- "rigol-byte" – "Chart data" must be a blob containing 8-bit unsigned integer numbers
- "rigol-word" – "Chart data" must be a blob containing 16-bit unsigned integer numbers
- "csv" – "Chart data" must be a CSV string, the first column is taken

This property is only used when the `Chart mode` is `Single chart`.

##### W20.2.4. Sampling rate *EXPRESSION (integer)*

Sampling rate or number of samples per second (SPS).

This property is only used when the `Chart mode` is `Single chart`.

##### W20.2.5. Unit name *EXPRESSION (integer)*

The unit displayed on the Y-axis. The X-axis is always time.

This property is only used when the `Chart mode` is `Single chart`.

##### W20.2.6. Color *EXPRESSION (string)*

The color of the line in the chart.

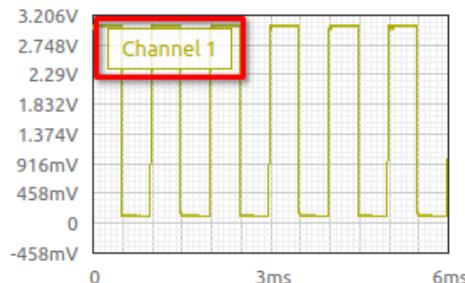

This property is only used when the `Chart mode` is `Single chart`.

##### W20.2.7. Label *EXPRESSION (string)*

Chart label:

07/24/2023 9:26:29 PM  
 application/eez-raw, 2.86 MB  
 Channel: 1, Sampling rate: 500 MS/s  
 Preamble: 0, 2, 3000000, 1, 2.000000e-09, -3.000000e-03, 0, 4.296875e-02, 1, 118

This property is only used when the `Chart mode` is `Single chart`.

#### **W20.2.8. Offset    *EXPRESSION (string)***

Offset value used in formula `offset + sample_value * scale` which transforms sample value to sample position on y axis in the chart.

This property is only used when the `Chart mode` is `Single chart`.

#### **W20.2.9. Scale    *EXPRESSION (string)***

When displaying samples, the formula `offset + sample_value * scale` is used.

This property is only used when the `Chart mode` is `Single chart`.

#### **W20.2.10. Charts    *Array***

List of chart definitions when `Chart mode` is set to `Multiple charts`. Each definition contains these properties:

- `Chart data`
- `Format`
- `Sampling rate`
- `Unit`
- `Color`
- `Label`
- `Offset`
- `Scale`

These properties have the same meaning as the corresponding property when `Single chart` mode is selected.

#### **W20.2.11. History item ID    *EXPRESSION (string)***

This ID is obtained using `AddToInstrumentHistory` action through `id` output of that action.

This property is only used when the `Chart mode` is `Instrument History Item`.

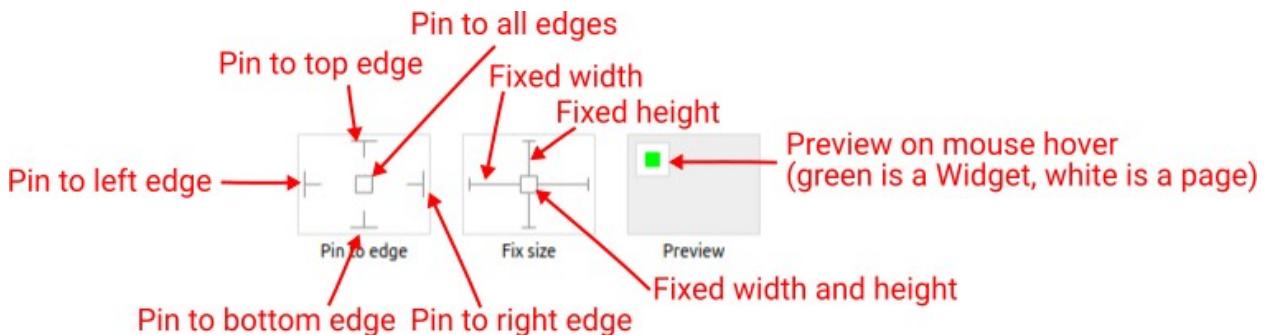

#### **W20.2.12. Visible    *EXPRESSION (boolean)***

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

### **Position and size**

### W20.2.13. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

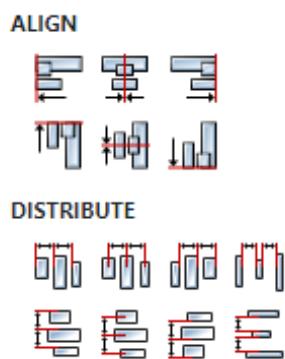

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W20.2.14. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W20.2.15. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W20.2.16. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), sim-

ple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W20.2.17. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W20.2.18. Width Number**

The width of the component. It is set in pixels.

### **W20.2.19. Height Number**

The height of the component. It is set in pixels.

### **W20.2.20. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

### **W20.2.21. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## **Style**

### **W20.2.22. Default Object**

Style used when rendering of the Widget.

## **Events**

### **W20.2.23. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## **Flow**

### **W20.2.24. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to

check whether a data line that transmits data of that type is connected to the input or not.

#### **W20.2.25. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

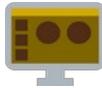

#### **W20.2.26. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W20.3. Examples**

- *Line Chart*
- *EEZ Chart*
- *Rigol Waveform Data*

## W21. Embedded Dashboard

### W21.1. Description

Use this widget to embed external dashboard project.

### W21.2. Properties

#### Specific

##### W21.2.1. Dashboard *EXPRESSION (string)*

Location of the external dashboard project. It can be absolute file path, relative file path or HTTP(S) URL.

##### W21.2.2. Open dashboard *Any*

Use this button as convenience shortcut to open external dashboard project inside Project Editor. Not available if external dashboard location is given by HTTP(S) URL.

##### W21.2.3. Dashboard parameters *Array*

List of parameters where each parameter is specified by the name and value. Each parameter name must correspond to the global variable name in the external dashboard. When host dashboard runs, parameter values will be continuously evaluated at the host dashboard side and associated global variables inside external dashboard will be changed.

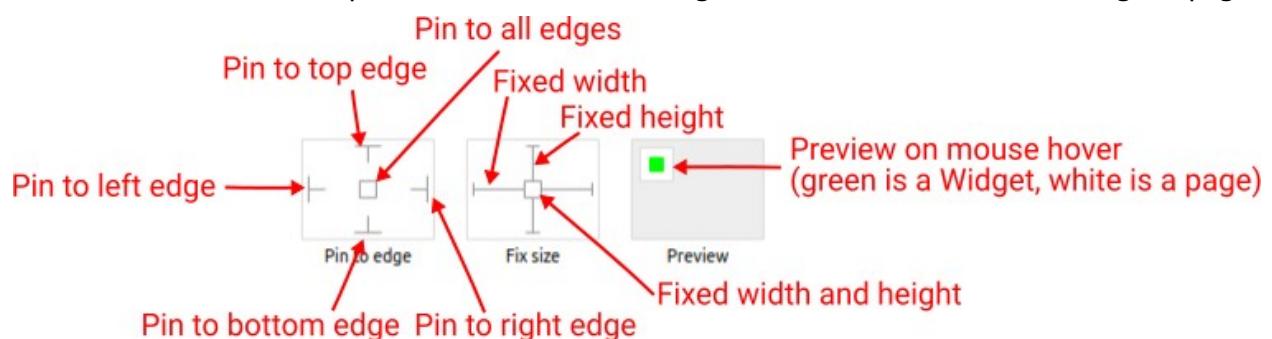

##### W21.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W21.2.5. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

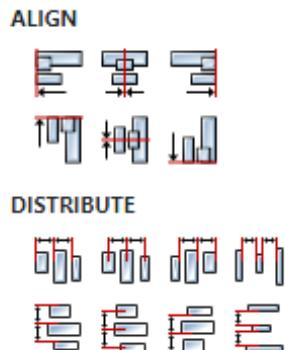

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W21.2.6. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W21.2.7. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W21.2.8. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

### W21.2.9. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W21.2.10. Width Number

The width of the component. It is set in pixels.

### W21.2.11. Height Number

The height of the component. It is set in pixels.

### W21.2.12. Absolute position String

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### W21.2.13. Tab title EXPRESSION (string)

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Events

### W21.2.14. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W21.2.15. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W21.2.16. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

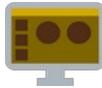

### W21.2.17. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W21.3. Examples

- BB3 SCPI Terminal and Dashboard

## W22. Gauge (Dashboard)

### W22.1. Description

Displays the value selected through the `Data` property inside the gauge chart.

### W22.2. Properties

#### Specific

##### W22.2.1. Data *EXPRESSION (any)*

The value within the `[Min, Max]` range that is displayed in the Widget.

##### W22.2.2. Title *String*

The name displayed above the gauge chart.

##### W22.2.3. Min range *EXPRESSION (float)*

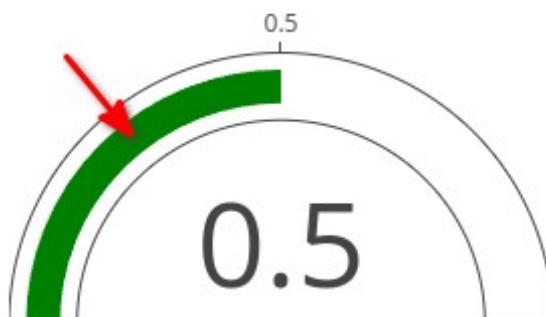

The minimum value that `Data` can contain.

##### W22.2.4. Max range *EXPRESSION (float)*

The maximum value that `Data` can contain.

##### W22.2.5. Color *Color*

The color of the arc bar inside the chart.

##### W22.2.6. Margin *Object*

Manually selected margin values between the Widget borders and the chart itself within the Widget.

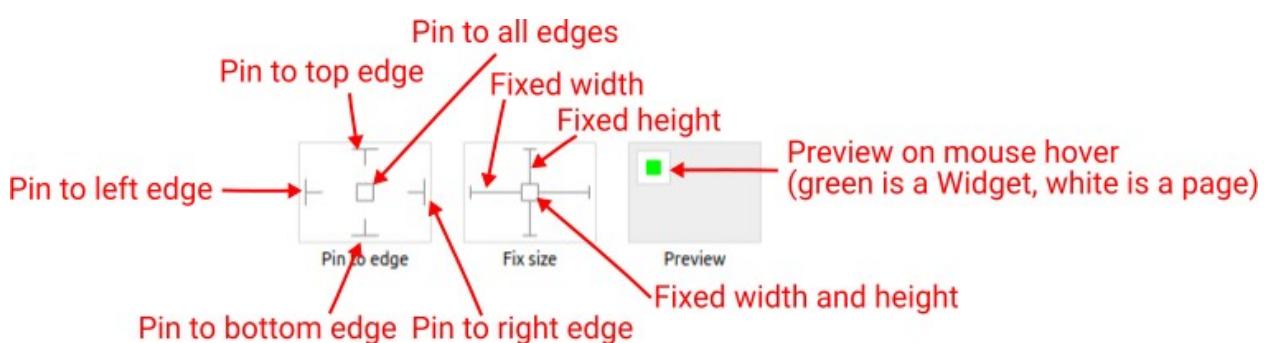

##### W22.2.7. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W22.2.8. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

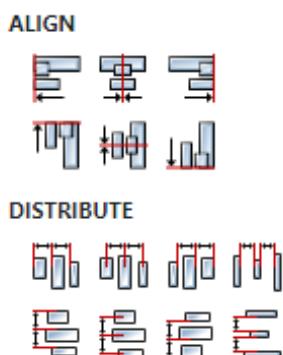

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W22.2.9. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W22.2.10. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W22.2.11. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the **Top**, **Width** and **Height** properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use **+**, **-**, **\*** and **/** operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W22.2.12. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W22.2.13. Width** *Number*

The width of the component. It is set in pixels.

**W22.2.14. Height** *Number*

The height of the component. It is set in pixels.

**W22.2.15. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W22.2.16. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W22.2.17. Default** *Object*

Style used when rendering the background of the Widget.

**Events****W22.2.18. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W22.2.19. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W22.2.20. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a

name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### **W22.2.21. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W22.3. Examples**

- *Dashboard Widgets Demo*

## W23. Gauge (EEZ-GUI)

### W23.1. Description

Displays the value selected through the `Data` property inside the gauge chart. Also, if it is set, it will also show the threshold line at the given positions, for example to mark some critical value.

### W23.2. Properties

#### Specific

##### W23.2.1. Data *EXPRESSION (any)*

The value within the `[Min, Max]` range that is displayed in the Widget.

##### W23.2.2. Min *EXPRESSION (any)*

The minimum value that `Data` can contain.

##### W23.2.3. Max *EXPRESSION (any)*

The maximum value that `Data` can contain.

##### W23.2.4. Threshold *EXPRESSION (any)*

An optional value within the range `[Min, Max]` at the position of which a line will be drawn in the default style (Threshold style).

##### W23.2.5. Unit *EXPRESSION (any)*

The unit that will be displayed to the right of the `Data` value.

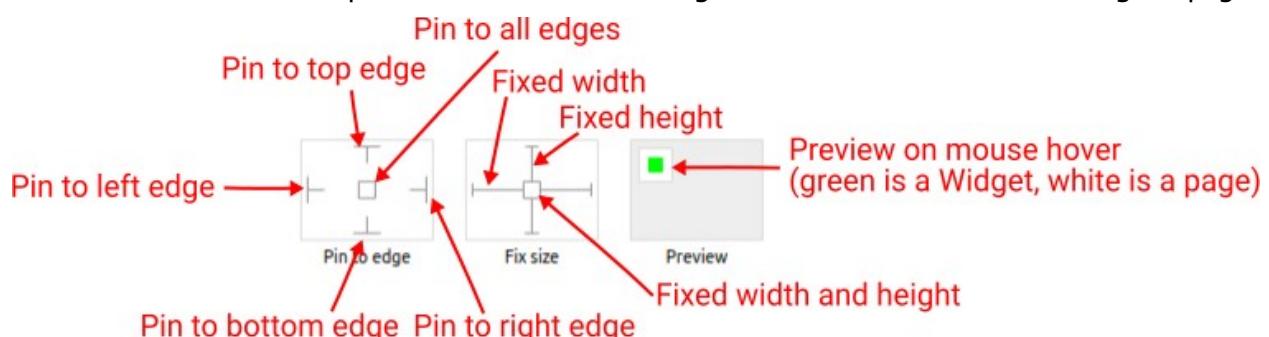

##### W23.2.6. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W23.2.7. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If

*Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

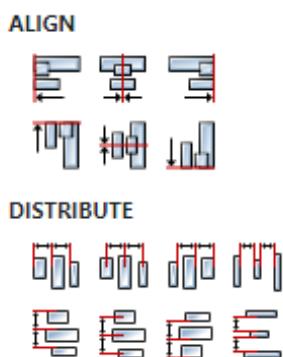

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W23.2.8. Hide "Widget is outside of its parent" warning   Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

### W23.2.9. Align and distribute   Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W23.2.10. Center widget   Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W23.2.11. Left   Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

### W23.2.12. Top   Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W23.2.13. Width   Number

The width of the component. It is set in pixels.

### W23.2.14. Height   Number

The height of the component. It is set in pixels.

**W23.2.15. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W23.2.16. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W23.2.17. Default** *Object*

Style used when rendering the background of the Widget.

**W23.2.18. Bar** *Object*

Style used to render the bar inside the Widget.

**W23.2.19. Value** *Object*

Style used to render the value specified through `Data`.

**W23.2.20. Ticks** *Object*

The style used to render the ticks on the scale.

**W23.2.21. Threshold** *Object*

Style used to render the threshold line.

**Events****W23.2.22. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W23.2.23. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### **W23.2.24. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W23.2.25. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W23.3. Examples**

- *eez-gui-widgets-demo*

## W24. Grid

### W24.1. Description

Use this Widget when you want to display the same Widget multiple times inside the grid. This Widget has one Child widget under it, and the number of times it will be displayed depends on the `Data` property.

Multiplied Widgets depending on the `Grid flow` property can be displayed by filling the rows first:

Widget #0	Widget #1	Widget #2	Widget #3
Widget #4	Widget #5	Widget #6	Widget #7
Widget #8	Widget #9	Widget #10	Widget #11
Widget #12	Widget #13	Widget #14	Widget #15
Widget #16	Widget #17	Widget #18	Widget #19
Widget #20	Widget #21	Widget #22	Widget #23

... or columns:

Widget #0	Widget #6	Widget #12	Widget #18
Widget #1	Widget #7	Widget #13	Widget #19
Widget #2	Widget #8	Widget #14	Widget #20
Widget #3	Widget #9	Widget #15	Widget #21
Widget #4	Widget #10	Widget #16	Widget #22
Widget #5	Widget #11	Widget #17	Widget #23

It wouldn't be very useful if multiplied Widgets always had the same content, that's why there is a system variable `$index` that tells us in which order the Widget is rendered. That variable is zero based, that means when its value is 0 then the first Widget is rendered, when its value is 1 then the second Widget is rendered and so on. That `$index` can then be used within the expression of the property of the Child widget, and in this way it is achieved that each rendered Widget has different content (e.g. the contents shown above were created in such a way that we defined for the `Text` widget that the displayed text is calculated from the following expression: `"Widget # " + $index`).

## W24.2. Properties

### Specific

#### W24.2.1. Data *EXPRESSION (any)*

Determines how many times the Child widget will be multiplied, i.e. the number of elements in the grid. The value of this property can be an integer and then it is the number of elements, and if the value of this property is an array, then the number of elements in the list is equal to the number of elements in that array.

In the case of *EEZ-GUI* projects, the value of this property can also be `struct:$ScrollbarState`. The same structure is used for the `ScrollBar` Widget, which can then be connected to the `Grid` Widget via the `struct:$ScrollbarState` variable and thus enable scrolling of the list in case the total number of list elements is greater than the number of elements that fit within the `Grid` Widget.

More about the `struct:$ScrollbarState` system structure can be found in the `ScrollBar` Widget documentation.

#### W24.2.2. Grid flow *Enum*

Defines the grid filling method. We need to select `Row` if we want it to be filled row by row. We will select `Column` if we want it to be filled column by column.

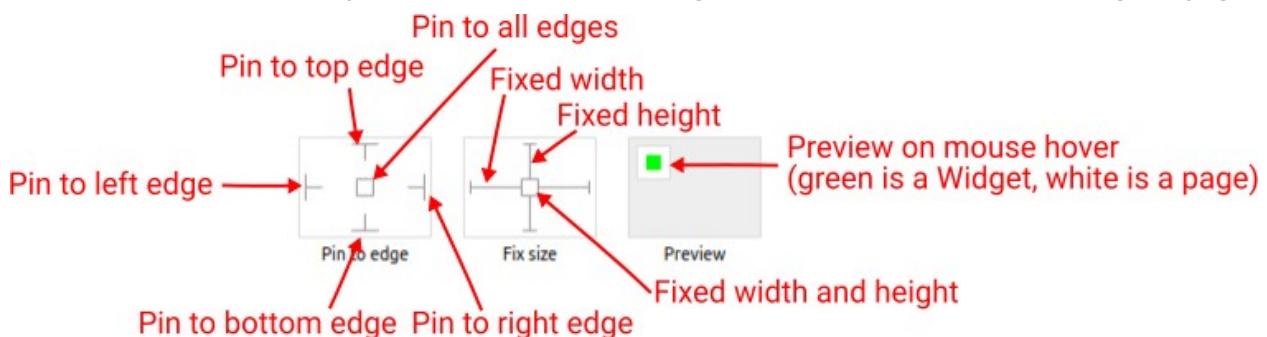

#### W24.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

### Position and size

#### W24.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If

*Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

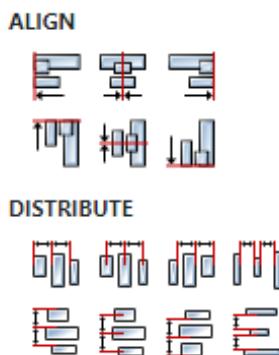

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### W24.2.5. Hide "Widget is outside of its parent" warning   Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

#### W24.2.6. Align and distribute   Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### W24.2.7. Center widget   Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### W24.2.8. Left   Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### W24.2.9. Top   Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### W24.2.10. Width   Number

The width of the component. It is set in pixels.

#### W24.2.11. Height   Number

The height of the component. It is set in pixels.

**W24.2.12. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W24.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W24.2.14. Default** *Object*

Style used when rendering the background of the Widget.

**Events****W24.2.15. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W24.2.16. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W24.2.17. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W24.2.18. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### W24.3. Examples

- *eez-gui-widgets-demo*
- *Tetris*

## W25. Image

### W25.1. Description

This Widget displays an image.  
More info ([link](#))

### W25.2. Properties

#### Specific

##### W25.2.1. Image *ObjectReference*

The name of the bitmap to be displayed.

##### W25.2.2. Pivot X *Number*

X position of the center of rotation. If left blank, the center of rotation is in the middle of the Widget.

##### W25.2.3. Pivot Y *Number*

Y position of the center of rotation. If left blank, the center of rotation is in the middle of the Widget.

##### W25.2.4. Scale *Number*

Scale factor. Set factor to 256 to disable zooming. A larger value enlarges the images (e.g. 512 double size), a smaller value shrinks it (e.g. 128 half size). Fractional scale works as well, e.g. 281 for 10% enlargement.

##### W25.2.5. Rotation *Number*

Rotation angle, angle has 0.1 degree precision, so for 45.8° set 458. Image is rotated around the center of rotation which is defined with `Pivot X` and `Pivot Y` properties.

#### General

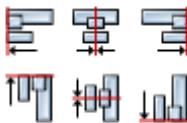

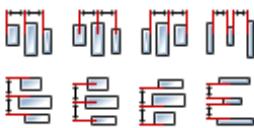

##### W25.2.6. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W25.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W25.2.8. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W25.2.9. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W25.2.10. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W25.2.11. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W25.2.12. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W25.2.13. Width Number**

The width of the component. It is set in pixels.

**W25.2.14. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W25.2.15. Height** *Number*

The height of the component. It is set in pixels.

**W25.2.16. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W25.2.17. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W25.2.18. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W25.2.19. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W25.2.20. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W25.2.21. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W25.2.22. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W25.2.23. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W25.2.24. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W25.2.25. Scrollable** *Boolean*

Make the object scrollable.

**W25.2.26. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W25.2.27. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W25.2.28. Scroll one Boolean**

Allow scrolling only one snappable children.

**W25.2.29. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W25.2.30. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W25.2.31. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W25.2.32. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W25.2.33. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W25.2.34. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W25.2.35. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W25.2.36. Event bubble Boolean**

Propagate the events to the parent too.

**W25.2.37. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W25.2.38. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W25.2.39. Ignore layout Boolean**

Make the object positionable by the layouts.

**W25.2.40. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W25.2.41. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W25.2.42. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W25.2.43. Checked state type** *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W25.2.44. Disabled** *EXPRESSION (boolean)*

Disabled state

#### **W25.2.45. Disabled state type** *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W25.2.46. Focused** *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W25.2.47. Pressed** *Boolean*

Being pressed.

### Events

#### **W25.2.48. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### Flow

#### **W25.2.49. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W25.2.50. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W25.2.51. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

put. The data that will be passed through that output is the textual description of the error.

### ***W25.3. Examples***

- *LVGL Widgets Demo*

## W26. Imgbutton

### W26.1. Description

The `Imgbutton` is very similar to the simple `Button` Widget. The only difference is that it displays user-defined images in each state instead of drawing a rectangle.

More info ([link](#))

### W26.2. Properties

#### Specific

##### W26.2.1. Released image *ObjectReference*

The image for the `Released` state.

##### W26.2.2. Pressed image *ObjectReference*

The image for the `Pressed` state.

##### W26.2.3. Disabled image *ObjectReference*

The image for the `Disabled` state.

##### W26.2.4. Checked released image *ObjectReference*

The image when the widget is in the both `Checked` and `Disabled` state.

##### W26.2.5. Checked pressed image *ObjectReference*

The image when the widget is in the both `Checked` and `Pressed` state.

##### W26.2.6. Checked disabled image *ObjectReference*

The image when the Widget is in the both `Checked` and `Disabled` state.

#### General

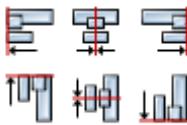

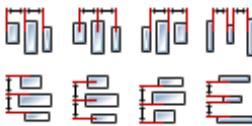

##### W26.2.7. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W26.2.8. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W26.2.9. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W26.2.10. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W26.2.11. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W26.2.12. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W26.2.13. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W26.2.14. Width Number**

The width of the component. It is set in pixels.

**W26.2.15. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W26.2.16. Height** *Number*

The height of the component. It is set in pixels.

**W26.2.17. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W26.2.18. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W26.2.19. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W26.2.20. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W26.2.21. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W26.2.22. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W26.2.23. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W26.2.24. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W26.2.25. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W26.2.26. Scrollable** *Boolean*

Make the object scrollable.

**W26.2.27. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W26.2.28. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W26.2.29. Scroll one Boolean**

Allow scrolling only one snappable children.

**W26.2.30. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W26.2.31. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W26.2.32. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W26.2.33. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W26.2.34. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W26.2.35. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W26.2.36. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W26.2.37. Event bubble Boolean**

Propagate the events to the parent too.

**W26.2.38. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W26.2.39. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W26.2.40. Ignore layout Boolean**

Make the object positionable by the layouts.

**W26.2.41. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W26.2.42. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W26.2.43. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W26.2.44. Checked state type    Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W26.2.45. Disabled    EXPRESSION (boolean)**

Disabled state

#### **W26.2.46. Disabled state type    Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W26.2.47. Focused    Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W26.2.48. Pressed    Boolean**

Being pressed.

### **Events**

#### **W26.2.49. Event handlers    Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### **Flow**

#### **W26.2.50. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W26.2.51. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W26.2.52. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

put. The data that will be passed through that output is the textual description of the error.

### ***W26.3. Examples***

- *LVGL Widgets Demo*

### W27.1. Description

The widget is used when we want to enter a number or text. In order for this widget to work, the project must define a page for entering text and a page for entering numbers. See some of the examples listed under *Examples* of how these pages are defined.

### W27.2. Properties

#### Specific

##### W27.2.1. Data *EXPRESSION (any)*

The variable in which the entered number or text will be stored.

##### W27.2.2. Input type *Enum*

Choose whether `Number` or `Text` is entered.

##### W27.2.3. Min *EXPRESSION (any)*

If `Input type` is set to `Number` then this number represents the minimum number that needs to be entered, and if it is set to `Text` then this property represents the minimum number of characters that need to be entered.

##### W27.2.4. Max *EXPRESSION (any)*

If `Input type` is set to `Number` then this number represents the maximum number that needs to be entered, and if it is set to `Text` then this property represents the maximum number of characters that need to be entered.

##### W27.2.5. Precision *EXPRESSION (any)*

If `Input type` is set to `Number` then this property defines the precision of the entered number. If a number with higher precision (more decimal places) is entered, then the number will be rounded to this precision. For example if we set it to `0.01` then the number will be rounded to two decimal places.

##### W27.2.6. Unit *EXPRESSION (any)*

If `Input type` is set to `Number` then this property defines the unit that will be used, i.e. printed to the right of the numerical value.

##### W27.2.7. Password *Boolean*

If `Input type` is set to `Text` and a password is entered, then this property should be enabled so that `*` is displayed instead of characters when entering the password.

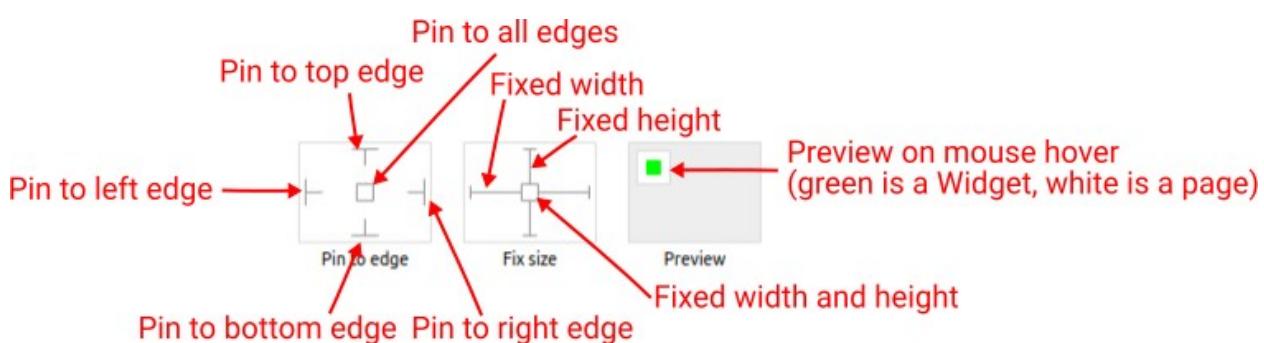

##### W27.2.8. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W27.2.9. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the *Top* position does not change the value. If *Pin to top edge* is not selected, then the *Top* position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

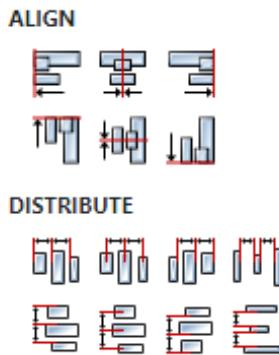

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### W27.2.10. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

#### W27.2.11. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### W27.2.12. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### W27.2.13. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the *Top*, *Width* and *Height* properties), simple mathematical expressions can be used. When we enter an expression and press enter, the ex-

pression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

#### **W27.2.14. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W27.2.15. Width Number**

The width of the component. It is set in pixels.

#### **W27.2.16. Height Number**

The height of the component. It is set in pixels.

#### **W27.2.17. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

### **Layout**

#### **W27.2.18. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

### **Style**

#### **W27.2.19. Default Object**

Style used when rendering of the Widget.

### **Events**

#### **W27.2.20. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### **Flow**

#### **W27.2.21. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### **W27.2.22. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W27.2.23. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W27.3. Examples**

- *eez-gui-widgets-demo*
- *stm32f469i-disco-eez-flow-demo*

## W28. Keyboard

### W28.1. Description

The virtual (on screen) keyboard to write texts into a Text area.  
More info ([link](#))

### W28.2. Properties

#### Specific

##### W28.2.1. Textarea *Enum*

The name of `Textarea` Widget attached to this Widget.

##### W28.2.2. Mode *Enum*

The following modes are available:

- `TEXT_LOWER` – Display lower case letters.
- `TEXT_UPPER` – Display upper case letters.
- `SPECIAL` – Display special characters.
- `NUMBER` – Display numbers, +/- sign, and decimal dot.
- `USER_1` to `USER_4` – User-defined modes.

#### General

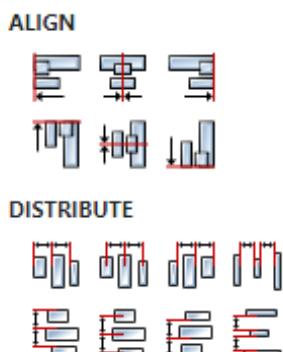

##### W28.2.3. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W28.2.4. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W28.2.5. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### **W28.2.6. Left    Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2`.

### **W28.2.7. Left unit    Enum**

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

### **W28.2.8. Top    Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W28.2.9. Top unit    Enum**

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

### **W28.2.10. Width    Number**

The width of the component. It is set in pixels.

### **W28.2.11. Width unit    Enum**

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### **W28.2.12. Height    Number**

The height of the component. It is set in pixels.

### **W28.2.13. Height unit    Enum**

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## **Layout**

### **W28.2.14. Tab title    EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### **W28.2.15. Use style    ObjectReference**

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

### **W28.2.16. Hidden    EXPRESSION (boolean)**

Make the object hidden.

### **W28.2.17. Hidden flag type    Enum**

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

### **W28.2.18. Clickable    EXPRESSION (boolean)**

Make the object clickable by input devices.

### **W28.2.19. Clickable flag type    Enum**

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

### **W28.2.20. Click focusable    Boolean**

Add focused state to the object when clicked.

### **W28.2.21. Checkable    Boolean**

Toggle checked state when the object is clicked.

### **W28.2.22. Scrollable    Boolean**

Make the object scrollable.

### **W28.2.23. Scroll elastic    Boolean**

Allow scrolling inside but with slower speed.

### **W28.2.24. Scroll momentum    Boolean**

Make the object scroll further when "thrown".

### **W28.2.25. Scroll one    Boolean**

Allow scrolling only one snappable children.

### **W28.2.26. Scroll chain hor    Boolean**

Allow propagating the horizontal scroll to a parent.

### **W28.2.27. Scroll chain ver    Boolean**

Allow propagating the vertical scroll to a parent.

### **W28.2.28. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W28.2.29. Scroll on focus**    *Boolean*

Automatically scroll object to make it visible when focused.

**W28.2.30. Scroll with arrow**    *Boolean*

Allow scrolling the focused object with arrow keys.

**W28.2.31. Snappable**    *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W28.2.32. Press lock**    *Boolean*

Keep the object pressed even if the press slid from the object.

**W28.2.33. Event bubble**    *Boolean*

Propagate the events to the parent too.

**W28.2.34. Gesture bubble**    *Boolean*

Propagate the gestures to the parent.

**W28.2.35. Adv hitest**    *Boolean*

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W28.2.36. Ignore layout**    *Boolean*

Make the object positionable by the layouts.

**W28.2.37. Floating**    *Boolean*

Do not scroll the object when the parent scrolls and ignore layout.

**W28.2.38. Overflow visible**    *Boolean*

Do not clip the children's content to the parent's boundary.

**States****W28.2.39. Checked**    *EXPRESSION (boolean)*

Toggled or checked state.

**W28.2.40. Checked state type**    *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W28.2.41. Disabled**    *EXPRESSION (boolean)*

Disabled state

**W28.2.42. Disabled state type**    *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W28.2.43. Focused**    *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

**W28.2.44. Pressed Boolean**

Being pressed.

**Events****W28.2.45. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W28.2.46. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

**W28.2.47. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

**W28.2.48. Catch error Boolean**

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W28.3. Examples**

- *LVGL Widgets Demo*

## W29. Label

### W29.1. Description

A Widget used to display text.  
More info ([link](#))

### W29.2. Properties

#### Specific

##### W29.2.1. Text *EXPRESSION (string)*

Text to be displayed.

##### W29.2.2. Text type *Enum*

Here we can choose whether the `Text` property will be calculated from the Expression.

##### W29.2.3. Long mode *Enum*

If `content` is selected for `Width` and `Height` then this item has no effect because the size of the Widget will be automatically set to fit the entire text, but if the size of the Widget is set manually (px or %) then using of this item defines one of the following ways in which the text will be split if it does not fit within the limits of the Widget:

- `WRAP` – Wrap too long lines. If the `Height` is set to `content` it will be expanded, otherwise the text will be clipped (Default).
- `DOT` – Replaces the last 3 characters from bottom right corner of the label with dots.
- `SCROLL` – If the text is wider than the label scroll it horizontally back and forth. If it's higher, scroll vertically. Only one direction is scrolled and horizontal scrolling has higher precedence.
- `SCROLL_CIRCULAR` – If the text is wider than the label scroll it horizontally continuously. If it's higher, scroll vertically. Only one direction is scrolled and horizontal scrolling has higher precedence.
- `CLIP` – Simply clip the parts of the text outside the label.

##### W29.2.4. Recolor *Boolean*

If this is enabled then, in the text, we can use commands to recolor parts of the text. For example: "Write a #ff0000 red# word".

#### General

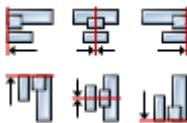

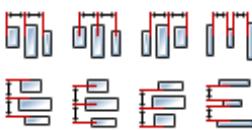

##### W29.2.5. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W29.2.6. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W29.2.7. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W29.2.8. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W29.2.9. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W29.2.10. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W29.2.11. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W29.2.12. Width Number**

The width of the component. It is set in pixels.

**W29.2.13. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W29.2.14. Height** *Number*

The height of the component. It is set in pixels.

**W29.2.15. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W29.2.16. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W29.2.17. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W29.2.18. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W29.2.19. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W29.2.20. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W29.2.21. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W29.2.22. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W29.2.23. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W29.2.24. Scrollable** *Boolean*

Make the object scrollable.

**W29.2.25. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W29.2.26. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W29.2.27. Scroll one Boolean**

Allow scrolling only one snappable children.

**W29.2.28. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W29.2.29. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W29.2.30. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W29.2.31. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W29.2.32. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W29.2.33. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W29.2.34. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W29.2.35. Event bubble Boolean**

Propagate the events to the parent too.

**W29.2.36. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W29.2.37. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W29.2.38. Ignore layout Boolean**

Make the object positionable by the layouts.

**W29.2.39. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W29.2.40. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W29.2.41. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W29.2.42. Checked state type    *Enum***

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W29.2.43. Disabled    *EXPRESSION (boolean)***

Disabled state

#### **W29.2.44. Disabled state type    *Enum***

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W29.2.45. Focused    *Boolean***

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W29.2.46. Pressed    *Boolean***

Being pressed.

### **Events**

#### **W29.2.47. Event handlers    *Array***

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### **Flow**

#### **W29.2.48. Inputs    *Array***

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W29.2.49. Outputs    *Array***

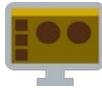

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W29.2.50. Catch error    *Boolean***

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

put. The data that will be passed through that output is the textual description of the error.

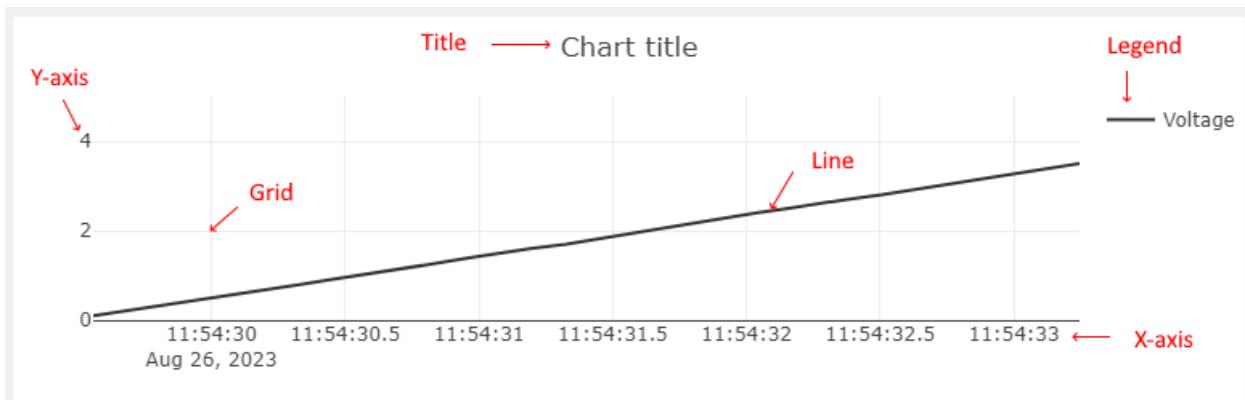

## W30. LineChart (Dashboard)

### W30.1. Description

Displays a Line chart consisting of the following parts:

- Title
- X Axis
- Y axis
- A legend
- Grid
- One or more lines

At the beginning of the chart there is not a single point on the lines. In order to add a point, it is necessary to pass the data through `value` input. One point is added for each applied data on that input. The X and Y values of that point on all lines should then be calculated from the received data. For example the received data can be a structure that has an X value and a Y value for each line.

### W30.2. Properties

#### Specific

##### W30.2.1. X value *EXPRESSION (any)*

Defines the value on the X-axis for the added point. It can be set to the current time with `Date.now()` or some other value, but care must be taken to increase the value with each newly added point.

##### W30.2.2. Lines *Array*

Defines one or more lines on the Y-axis. The following must be specified for each line:

- `Label` – The name of the line that is displayed in the Legend.
- `Color` – Color of the line.
- `Value` – The value on the Y axis for the added point.

##### W30.2.3. Title *String*

Name of the chart.

##### W30.2.4. Display mode bar *Enum*

When the mode bar with buttons will be displayed in the top right corner of the chart, possible options are: `Hover`, `Always` and `Never`.

**W30.2.5. Show legend Boolean**

It should be set if we want to display the legend.

**W30.2.6. Show xaxis Boolean**

It should be set if we want to display the X-axis.

**W30.2.7. Show yaxis Boolean**

It should be set if we want to display the Y-axis.

**W30.2.8. Show grid Boolean**

It should be set if we want to display the grid.

**W30.2.9. Show zero lines Boolean**

It should be set if we want to display zero lines.

**W30.2.10. X axis range option Enum**

Here we have two options:

- `Floating` – X-axis range will be automatically selected based on the X value at all points.
- `Fixed` – X-axis range is set via `X axis range from` and `X axis range to` items.

**W30.2.11. X axis range from EXPRESSION (double)**

If `Fixed` is selected for `X axis range option`, then the lower limit of the X-axis range is set with this item.

**W30.2.12. X axis range to EXPRESSION (double)**

If `Fixed` is selected for `X axis range option`, then the upper limit of the X-axis range is set with this item.

**W30.2.13. Y axis range option Enum**

Here we have two options:

- `Floating` – Y-axis range will be automatically selected based on the Y value at all points.
- `Fixed` – Y-axis range is set via `Y axis range from` and `Y axis range to` items.

**W30.2.14. Y axis range from EXPRESSION (double)**

If `Fixed` is selected for `Y axis range option`, then the lower limit of the Y-axis range is set with this item.

**W30.2.15. Y axis range to EXPRESSION (double)**

If `Fixed` is selected for `Y axis range option`, then the upper limit of the Y-axis range is set with this item.

**W30.2.16. Max points EXPRESSION (integer)**

The maximum number of points that will be displayed.

**W30.2.17. Margin Object**

Manually selected margin values between the Widget borders and the chart itself within the Widget. It is necessary to leave an empty space for Title (displayed above the chart, so the appropriate `Top` margin should be selected), X-axis (displayed below the chart, `Bottom` margin), Y-axis (displayed to the left of the chart, `Left` margin) and Legend (displayed to the right of the chart, `Right` margin).

**W30.2.18. Marker** EXPRESSION (float)

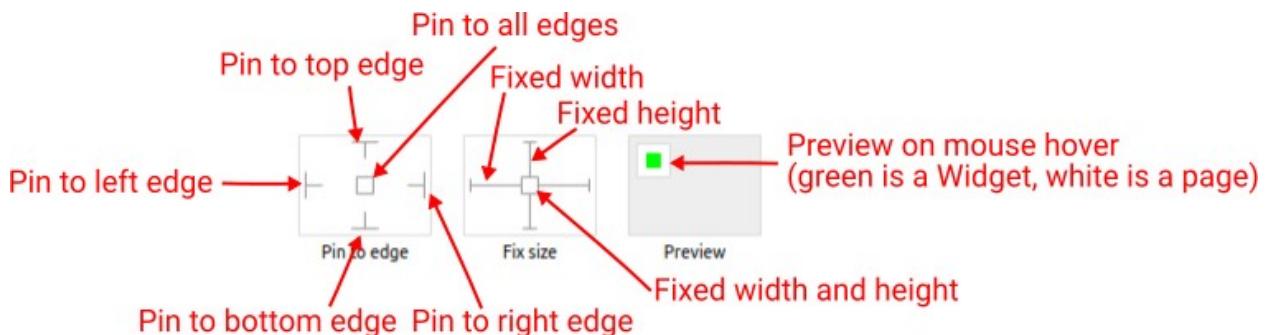

At this position, a vertical line will be displayed inside the chart using `Marker` style.

**W30.2.19. Visible** EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

**Position and size****W30.2.20. Resizing** Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

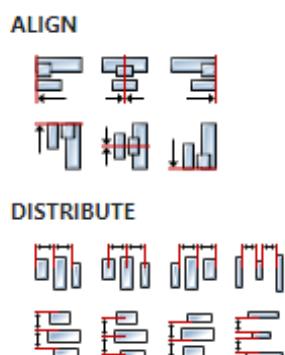

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W30.2.21. Align and distribute** Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W30.2.22. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W30.2.23. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W30.2.24. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W30.2.25. Width** *Number*

The width of the component. It is set in pixels.

**W30.2.26. Height** *Number*

The height of the component. It is set in pixels.

**W30.2.27. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W30.2.28. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W30.2.29. Default** *Object*

Style used when rendering of the Widget.

**W30.2.30. Marker** *Object*

Style used to render the marker.

**Events****W30.2.31. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W30.2.32. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W30.2.33. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W30.2.34. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W30.3. Inputs

### W30.3.1. reset DATA(any) / OPTIONAL

If we want to erase all the points on the chart, it is necessary to send a signal to this input.

### W30.3.2. value DATA(any) / MANDATORY

The input to which the value of the point that we want to add to the chart is sent. When the maximum number of points, which is set through the Max points item, is reached, then the oldest added point will be deleted.

## W30.4. Examples

- *Dashboard Widgets Demo*

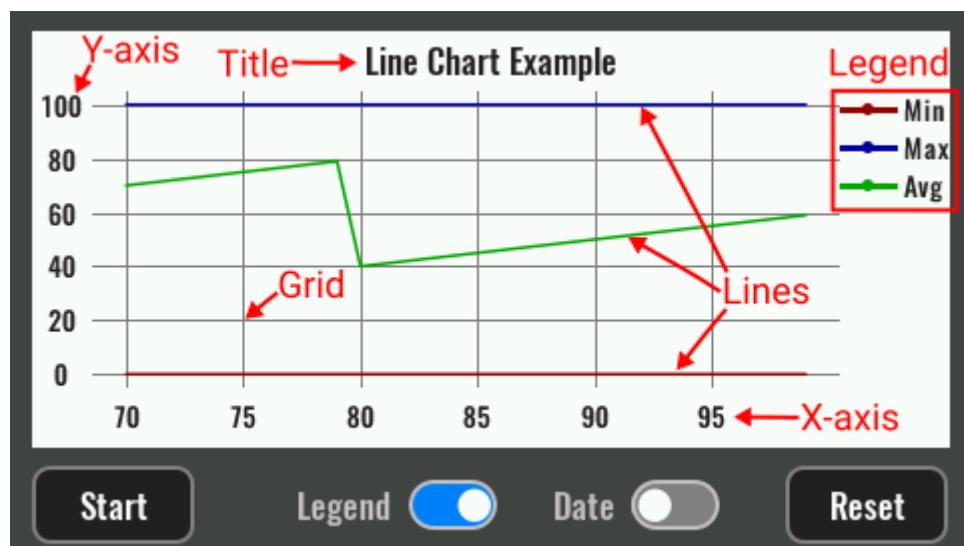

## W31. LineChart (EEZ-GUI)

### W31.1. Description

Displays a Line chart consisting of the following parts:

- Title
- X Axis
- Y axis
- A legend
- Grid
- One or more lines

At the beginning of the chart there is not a single point on the lines. In order to add a point, it is necessary to pass the data through `value` input. One point is added for each applied data on that input. The X and Y values of that point on all lines should then be calculated from the received data. For example the received data can be a structure that has an X value and a Y value for each line.

### W31.2. Properties

#### Specific

##### W31.2.1. X value *EXPRESSION (any)*

Defines the value on the X-axis for the added point. It can be set to the current time with `Date.now()` or some other value, but care must be taken to increase the value with each newly added point.

##### W31.2.2. Lines *Array*

Defines one or more lines on the Y-axis. The following must be specified for each line:

- `Label` – The name of the line that is displayed in the Legend.
- `Color` – Color of the line.
- `Line width` – The thickness of the line in pixels.
- `Value` – The value on the Y axis for the added point.

##### W31.2.3. Show title *EXPRESSION (boolean)*

It should be set if we want to render the title.

##### W31.2.4. Show legend *EXPRESSION (boolean)*

It should be set if we want to render the legend.

#### **W31.2.5. Show X axis** *EXPRESSION (boolean)*

It should be set if we want to render the X-axis.

#### **W31.2.6. Show Y axis** *EXPRESSION (boolean)*

It should be set if we want to render the Y-axis.

#### **W31.2.7. Show grid** *EXPRESSION (boolean)*

It should be set if we want to render the grid.

#### **W31.2.8. Title** *EXPRESSION (string)*

Name of the chart.

#### **W31.2.9. Y axis range option** *Enum*

Here we have two options:

- `Floating` – Y-axis range will be automatically selected based on the Y value at all points.
- `Fixed` – Y-axis range is set via `Y axis range from` and `Y axis range to` items.

#### **W31.2.10. Y axis range from** *EXPRESSION (double)*

If `Fixed` is selected for `Y axis range option`, then the lower limit of the Y-axis range is set with this item.

#### **W31.2.11. Y axis range to** *EXPRESSION (double)*

If `Fixed` is selected for `Y axis range option`, then the upper limit of the Y-axis range is set with this item.

#### **W31.2.12. Max points** *Number*

The maximum number of points that will be displayed.

#### **W31.2.13. Margin** *Object*

Manually selected margin values between the Widget borders and the chart itself within the Widget. It is necessary to leave an empty space for Title (displayed above the chart, so the appropriate `Top` margin should be selected), X-axis (displayed below the chart, `Bottom` margin), Y-axis (displayed to the left of the chart, `Left` margin) and Legend (displayed to the right of the chart, `Right` margin).

#### **W31.2.14. Marker** *EXPRESSION (float)*

At this position, a vertical line will be displayed inside the chart using `Marker` style.

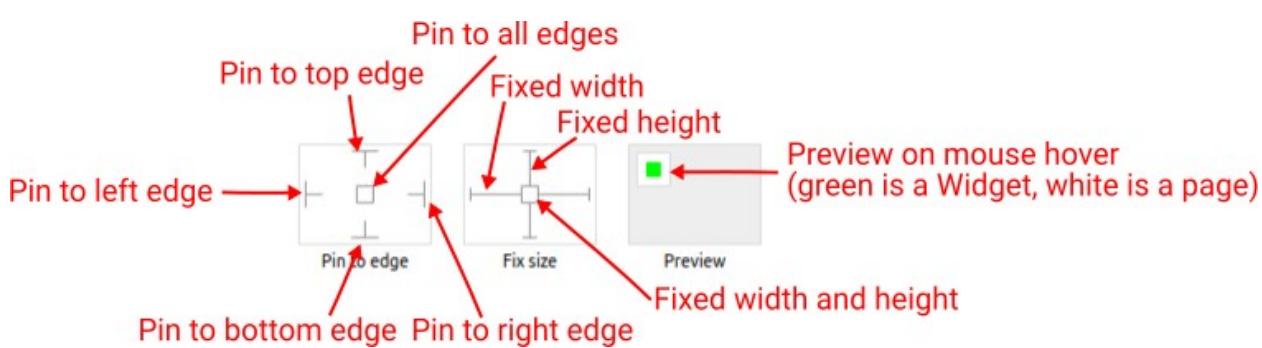

#### **W31.2.15. Visible** *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

### Position and size

#### **W31.2.16. Resizing** *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

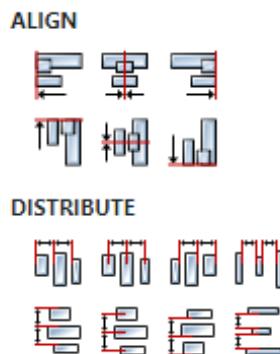

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W31.2.17. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

### W31.2.18. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W31.2.19. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W31.2.20. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the **Top**, **Width** and **Height** properties), simple mathematical expressions can be used. When we enter an expression and press enter, the ex-

pression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W31.2.21. Top    Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W31.2.22. Width    Number**

The width of the component. It is set in pixels.

### **W31.2.23. Height    Number**

The height of the component. It is set in pixels.

### **W31.2.24. Absolute position    String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

### **W31.2.25. Tab title    EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## **Style**

### **W31.2.26. Default    Object**

Style used when rendering of the Widget.

### **W31.2.27. Title    Object**

Style used to render the title.

### **W31.2.28. Legend    Object**

Style used to render the legend.

### **W31.2.29. X axis    Object**

Style used to render the X-axis.

### **W31.2.30. Y axis    Object**

Style used to render the Y-axis.

### **W31.2.31. Marker    Object**

Style used to render the marker.

## **Events**

### **W31.2.32. Event handlers    Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W31.2.33. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W31.2.34. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W31.2.35. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W31.3. Inputs

### W31.3.1. reset DATA(any) / OPTIONAL

If we want to erase all the points on the chart, it is necessary to send a signal to this input.

### W31.3.2. value DATA(any) / MANDATORY

The input to which the value of the point that we want to add to the chart is sent. When the maximum number of points, which is set through the Max points item, is reached, then the oldest added point will be deleted.

## W31.4. Examples

- *Line Chart*

## W32. List

### W32.1. Description

Use this Widget when you want to display the same Widget multiple times. This Widget has one Child widget under it, and the number of times it will be displayed depends on the `Data` property. Multiplied Widgets can be displayed by first filling rows or columns:

It wouldn't be very useful if multiplied Widgets always had the same content, that's why there is a system variable `$index` that tells us in which order the Widget is rendered. That variable is zero based, that means when its value is 0 then the first Widget is rendered, when its value is 1 then the second Widget is rendered and so on. That `$index` can then be used within the expression of the property of the Child widget, and in this way it is achieved that each rendered Widget has different content (e.g. the `Text` Widget can display a string that is taken from an array variable: `country_cities[$index].country`).

### W32.2. Properties

#### Specific

##### W32.2.1. Data *EXPRESSION (any)*

Determines how many times the Child widget will be multiplied, i.e. the number of elements in the list. The value of this property can be an integer and then it is the number of elements, and if the value of this property is an array, then the number of elements in the list is equal to the number of elements in that array.

In the case of *EEZ-GUI* projects, the value of this property can also be `struct:$ScrollbarState`. The same structure is used for the `ScrollBar` Widget, which can then be connected to the `List` Widget via the `struct:$ScrollbarState` variable and thus enable scrolling of the list in case the total number of list elements is greater than the number of elements that fit within the `List` Widget.

More about the `struct:$ScrollbarState` system structure can be found in the `ScrollBar` Widget documentation.

##### W32.2.2. List type *Enum*

Defines vertical or horizontal orientation.

##### W32.2.3. Gap *Number*

The distance in pixels between two grid elements.

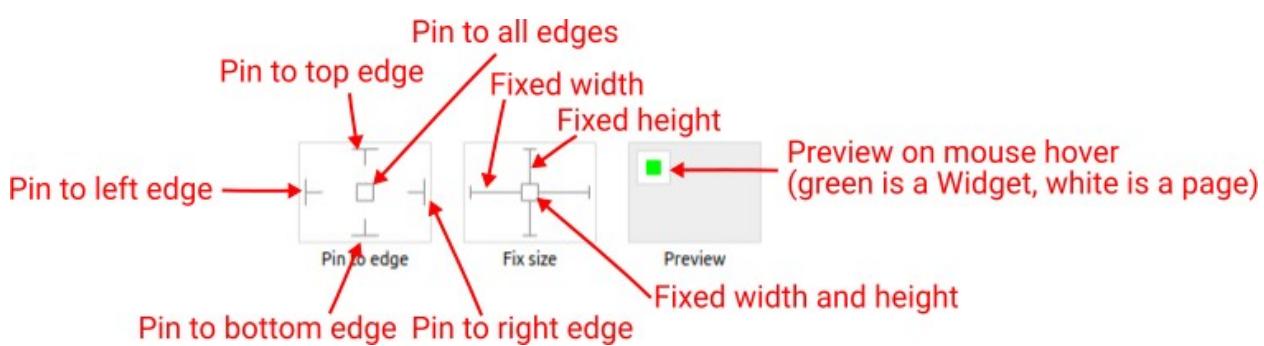

##### W32.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W32.2.5. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

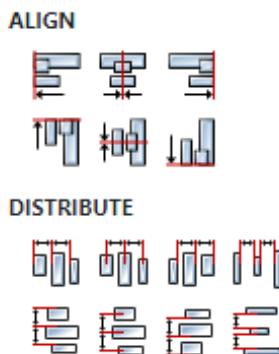

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W32.2.6. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

### W32.2.7. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W32.2.8. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W32.2.9. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the **Top**, **Width** and **Height** properties), simple mathematical expressions can be used. When we enter an expression and press enter, the ex-

pression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

#### **W32.2.10. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W32.2.11. Width Number**

The width of the component. It is set in pixels.

#### **W32.2.12. Height Number**

The height of the component. It is set in pixels.

#### **W32.2.13. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

### **Layout**

#### **W32.2.14. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

### **Style**

#### **W32.2.15. Default Object**

Style used when rendering the background of the Widget.

### **Events**

#### **W32.2.16. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### **Flow**

#### **W32.2.17. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W32.2.18. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**W32.2.19. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W32.3. Examples**

- *eez-gui-widgets-demo*
- *CSV*
- *JSON*
- *MQTT*
- *Simple HTTP*
- *Charts*
- *Regexp String*
- *Multi-Language*

## W33. Markdown

### W33.1. Description

Widget for displaying Markdown text.

### W33.2. Properties

#### Specific

##### W33.2.1. Text *MultilineText*

Markdown text to be displayed.

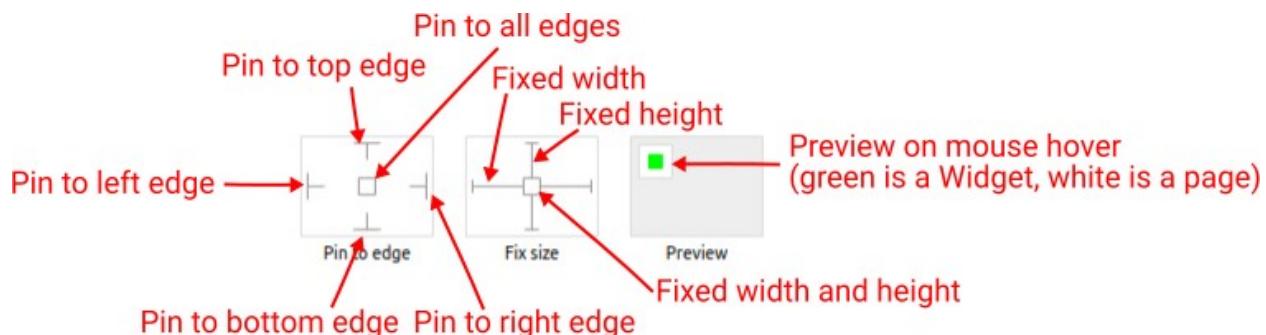

##### W33.2.2. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W33.2.3. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

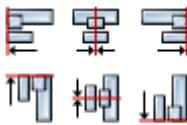

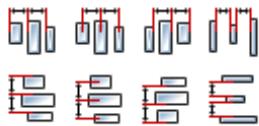

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W33.2.4. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W33.2.5. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W33.2.6. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W33.2.7. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W33.2.8. Width Number**

The width of the component. It is set in pixels.

**W33.2.9. Height Number**

The height of the component. It is set in pixels.

**W33.2.10. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W33.2.11. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W33.2.12. Default Object**

Style used when rendering the background of the Widget.

## Events

### W33.2.13. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W33.2.14. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W33.2.15. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### W33.2.16. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W33.3. Examples

- *Dashboard Widgets Demo*

## W34. Meter

### W34.1. Description

The `Meter` Widget can visualize data in very flexible ways. It can show arcs, needles, ticks lines and labels.

More info ([link](#))

### W34.2. Properties

#### Specific

##### W34.2.1. Scales *Array*

List of scale definitions. The Scale has minor and major ticks and labels on the major ticks. One or more indicator can be added to each scales. There are four different type of indicators:

- Needle image
- Needle line
- Scale lines
- Arc

#### General

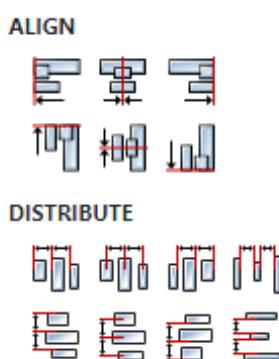

##### W34.2.2. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W34.2.3. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W34.2.4. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W34.2.5. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W34.2.6. Left unit** *Enum*

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

**W34.2.7. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W34.2.8. Top unit** *Enum*

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

**W34.2.9. Width** *Number*

The width of the component. It is set in pixels.

**W34.2.10. Width unit** *Enum*

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

**W34.2.11. Height** *Number*

The height of the component. It is set in pixels.

**W34.2.12. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W34.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style**

**W34.2.14. Use style    ObjectReference**

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W34.2.15. Hidden    EXPRESSION (boolean)**

Make the object hidden.

**W34.2.16. Hidden flag type    Enum**

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W34.2.17. Clickable    EXPRESSION (boolean)**

Make the object clickable by input devices.

**W34.2.18. Clickable flag type    Enum**

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W34.2.19. Click focusable    Boolean**

Add focused state to the object when clicked.

**W34.2.20. Checkable    Boolean**

Toggle checked state when the object is clicked.

**W34.2.21. Scrollable    Boolean**

Make the object scrollable.

**W34.2.22. Scroll elastic    Boolean**

Allow scrolling inside but with slower speed.

**W34.2.23. Scroll momentum    Boolean**

Make the object scroll further when "thrown".

**W34.2.24. Scroll one    Boolean**

Allow scrolling only one snappable children.

**W34.2.25. Scroll chain hor    Boolean**

Allow propagating the horizontal scroll to a parent.

**W34.2.26. Scroll chain ver    Boolean**

Allow propagating the vertical scroll to a parent.

**W34.2.27. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W34.2.28. Scroll on focus    Boolean**

Automatically scroll object to make it visible when focused.

**W34.2.29. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W34.2.30. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W34.2.31. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W34.2.32. Event bubble Boolean**

Propagate the events to the parent too.

**W34.2.33. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W34.2.34. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W34.2.35. Ignore layout Boolean**

Make the object positionable by the layouts.

**W34.2.36. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W34.2.37. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W34.2.38. Checked EXPRESSION (boolean)**

Toggled or checked state.

**W34.2.39. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W34.2.40. Disabled EXPRESSION (boolean)**

Disabled state

**W34.2.41. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W34.2.42. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W34.2.43. Pressed Boolean**

Being pressed.

## Events

### W34.2.44. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W34.2.45. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W34.2.46. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W34.2.47. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W34.3. Examples

- *Meter*
- *Dashboard Widgets Demo*

## W35. MultilineText

### W35.1. Description

A widget used to display multiple lines text.

### W35.2. Properties

#### Specific

##### W35.2.1. Text *EXPRESSION (any)*

Text to be displayed. This is an expression and if you only want to display some static text, then that text should be entered in quotation marks. If the expression uses variables, then that expression cannot be calculated in the editor, so the expression will be displayed instead of the text itself.

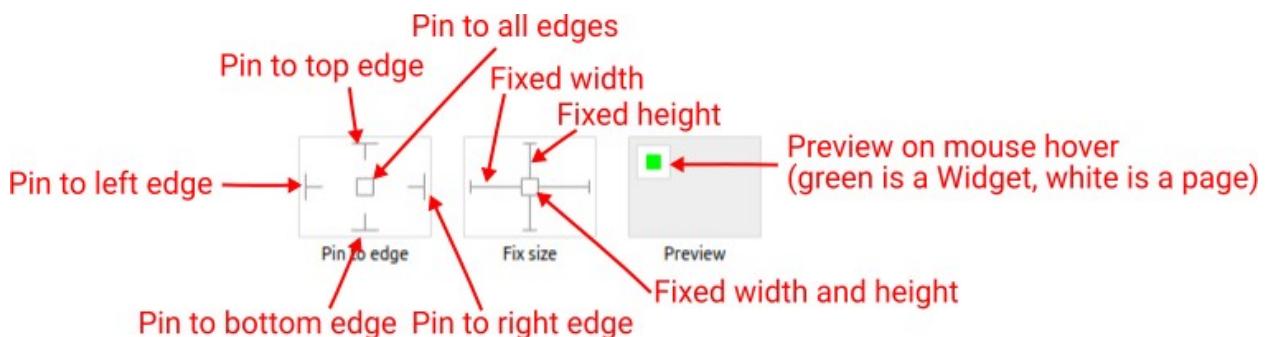

##### W35.2.2. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W35.2.3. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

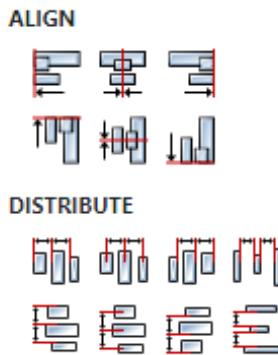

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W35.2.4. Hide "Widget is outside of its parent" warning *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

##### W35.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### **W35.2.6. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### **W35.2.7. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

### **W35.2.8. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W35.2.9. Width Number**

The width of the component. It is set in pixels.

### **W35.2.10. Height Number**

The height of the component. It is set in pixels.

### **W35.2.11. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### **W35.2.12. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to Docking Manager, use this property to set the title of the tab that contains this widget.

## General

### **W35.2.13. Name String**

If an expression is used for the `Text` property that cannot be calculated during editing, then the text displayed in the editor can be set here. Also, this text will be displayed in the *Widgets Structure* panel.

## Indentation

### **W35.2.14. First line** `Number`

First line indentation.

### **W35.2.15. Hanging** `Number`

Indentation of other lines.

## Style

### **W35.2.16. Default** `Object`

Style that will be used to render the Widget.

## Events

### **W35.2.17. Event handlers** `Array`

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### **W35.2.18. Inputs** `Array`

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### **W35.2.19. Outputs** `Array`

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W35.2.20. Catch error** `Boolean`

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

put. The data that will be passed through that output is the textual description of the error.

### ***W35.3. Examples***

- *eez-gui-widgets-demo*

## W36. NumberInput

### W36.1. Description

This Widget is used when we want to enter a number.

### W36.2. Properties

#### Specific

##### W36.2.1. Value *EXPRESSION (double)*

The variable in which the entered number will be stored.

##### W36.2.2. Min *EXPRESSION (double)*

The minimum value that can be entered.

##### W36.2.3. Max *EXPRESSION (double)*

The maximum value that can be entered.

##### W36.2.4. Step *EXPRESSION (double)*

The step is a number that specifies the granularity that the value must adhere to.

##### W36.2.5. Disable default tab handling *Boolean*

Set this to false if you want to disable default TAB key handling when this widget is in focus.

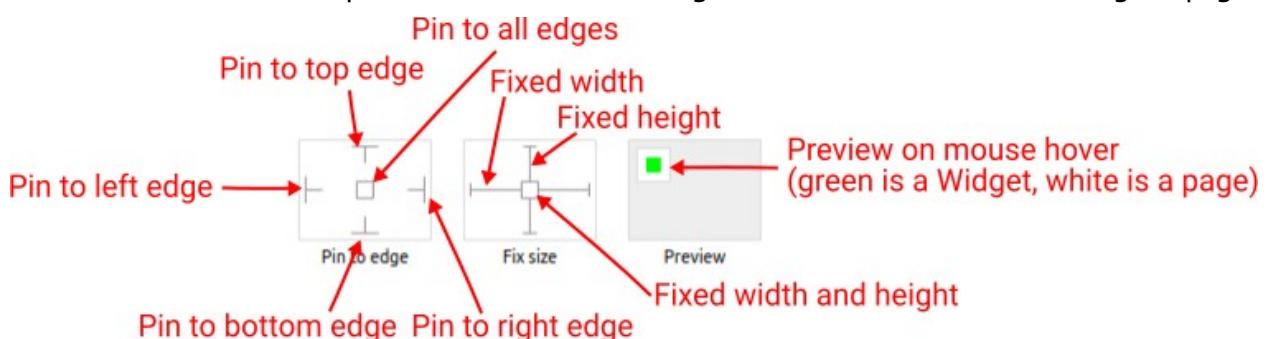

##### W36.2.6. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W36.2.7. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

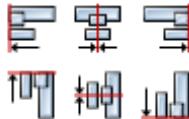

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

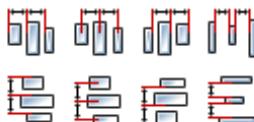

### W36.2.8. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### ALIGN

#### DISTRIBUTE

### W36.2.9. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W36.2.10. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

### W36.2.11. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W36.2.12. Width Number

The width of the component. It is set in pixels.

### W36.2.13. Height Number

The height of the component. It is set in pixels.

### W36.2.14. Absolute position String

The absolute position of the component in relation to the page. This property is read-only.

## Layout

**W36.2.15. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W36.2.16. Default** *Object*

Style used when rendering of the Widget.

**Events****W36.2.17. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W36.2.18. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W36.2.19. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W36.2.20. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W37. Panel

### W37.1. Description

It is used to group several Widgets, and it is used when we want to additionally organize a page that contains a large number of Widgets or if we want to perform some operation on several Widgets at once, e.g. hide using the `Hidden` flag of the Panel. When the Widget is inside the Panel, then its left and top coordinates are relative to the left and top of the Panel, which means that when the Panel is moved, all the Widgets inside it are also moved. Widgets are added to the Panel via the *Widgets Structure* panel using drag and drop.

### W37.2. Properties

#### General

##### W37.2.1. Name *String*

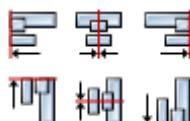

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

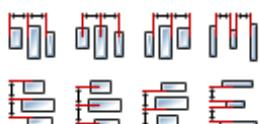

##### W37.2.2. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

###### ALIGN

###### DISTRIBUTE

##### W37.2.3. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

##### W37.2.4. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W37.2.5. Left unit** *Enum*

The following options are available:

- `px` – Left is default in pixels.
- `%` – Left is set as a percentage in relation to the parent width.

**W37.2.6. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W37.2.7. Top unit** *Enum*

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

**W37.2.8. Width** *Number*

The width of the component. It is set in pixels.

**W37.2.9. Width unit** *Enum*

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

**W37.2.10. Height** *Number*

The height of the component. It is set in pixels.

**W37.2.11. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W37.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W37.2.13. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W37.2.14. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

#### **W37.2.15. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

#### **W37.2.16. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

#### **W37.2.17. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

#### **W37.2.18. Click focusable** *Boolean*

Add focused state to the object when clicked.

#### **W37.2.19. Checkable** *Boolean*

Toggle checked state when the object is clicked.

#### **W37.2.20. Scrollable** *Boolean*

Make the object scrollable.

#### **W37.2.21. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

#### **W37.2.22. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

#### **W37.2.23. Scroll one** *Boolean*

Allow scrolling only one snappable children.

#### **W37.2.24. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

#### **W37.2.25. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

#### **W37.2.26. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

#### **W37.2.27. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

#### **W37.2.28. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

#### **W37.2.29. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

#### **W37.2.30. Press lock** *Boolean*

Keep the object pressed even if the press slid from the object.

#### **W37.2.31. Event bubble Boolean**

Propagate the events to the parent too.

#### **W37.2.32. Gesture bubble Boolean**

Propagate the gestures to the parent.

#### **W37.2.33. Adv hitest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

#### **W37.2.34. Ignore layout Boolean**

Make the object positionable by the layouts.

#### **W37.2.35. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

#### **W37.2.36. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

## **States**

#### **W37.2.37. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W37.2.38. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W37.2.39. Disabled EXPRESSION (boolean)**

Disabled state

#### **W37.2.40. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W37.2.41. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W37.2.42. Pressed Boolean**

Being pressed.

## **Events**

#### **W37.2.43. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.

- **Handler type** – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### **W37.2.44. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### **W37.2.45. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### **W37.2.46. Catch error Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W38. Progress (Dashboard)

### W38.1. Description

We can use this Widget, for example, when we want to display the execution progress of an operation.

### W38.2. Properties

#### Specific

##### W38.2.1. Data *EXPRESSION (integer)*

A value that goes from Min (progress is at 0%) to Max (progress is at 100%).

##### W38.2.2. Min *EXPRESSION (any)*

The minimum value that **Data** can contain.

##### W38.2.3. Max *EXPRESSION (any)*

The maximum value that **Data** can contain.

##### W38.2.4. Orientation *Enum*

There are two orientations that the **Progress** widget can have:

- Horizontal
- Vertical

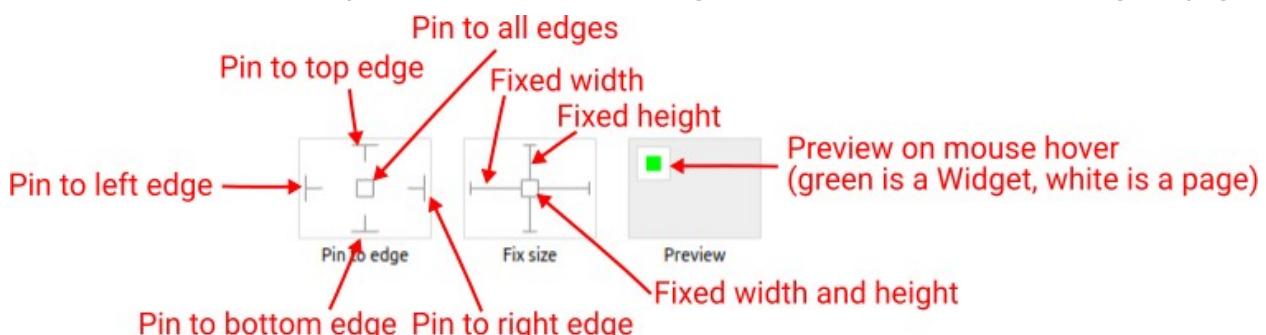

##### W38.2.5. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W38.2.6. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

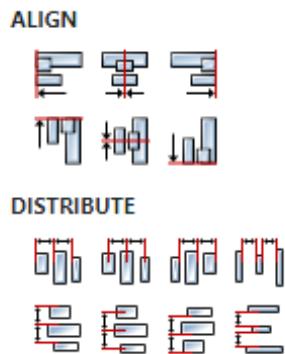

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the

width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W38.2.7. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W38.2.8. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W38.2.9. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the *Top*, *Width* and *Height* properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use *+*, *-*, *\** and */* operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2`.

### W38.2.10. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W38.2.11. Width Number

The width of the component. It is set in pixels.

### W38.2.12. Height Number

The height of the component. It is set in pixels.

### W38.2.13. Absolute position String

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### W38.2.14. Tab title EXPRESSION (string)

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W38.2.15. Default Object

Style used when rendering of the Widget.

## Events

### W38.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W38.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W38.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### W38.2.19. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W38.3. Examples

- *Dashboard Widgets Demo*

### W39.1. Description

We can use this Widget, for example, when we want to display the execution progress of an operation.

### W39.2. Properties

#### Specific

##### W39.2.1. Data *EXPRESSION (integer)*

A value that goes from Min (progress is at 0%) to Max (progress is at 100%).

##### W39.2.2. Min *EXPRESSION (any)*

The minimum value that `Data` can contain.

##### W39.2.3. Max *EXPRESSION (any)*

The maximum value that `Data` can contain.

##### W39.2.4. Orientation *Enum*

There are two orientations that the `Progress` widget can have:

- Horizontal

- Vertical

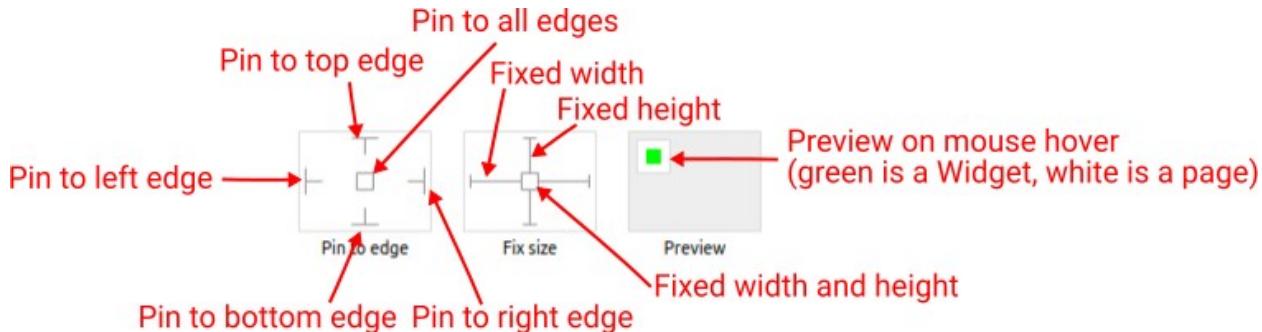

##### W39.2.5. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

## Position and size

### W39.2.6. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

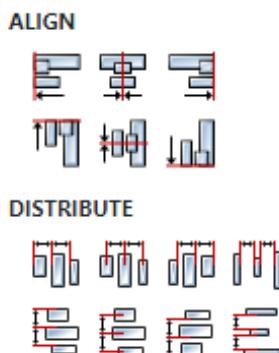

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W39.2.7. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

### W39.2.8. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W39.2.9. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W39.2.10. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W39.2.11. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W39.2.12. Width** *Number*

The width of the component. It is set in pixels.

**W39.2.13. Height** *Number*

The height of the component. It is set in pixels.

**W39.2.14. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W39.2.15. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W39.2.16. Default** *Object*

Style used when rendering of the Widget.

**Events****W39.2.17. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow**

### **W39.2.18. Inputs    Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### **W39.2.19. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### **W39.2.20. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W39.3. Examples**

- *eez-gui-widgets-demo*

## W40. QRCode (Dashboard)

### W40.1. Description

Renders a QR Code representing the given text string at the given error correction level.

### W40.2. Properties

#### Specific

##### W40.2.1. Text *EXPRESSION (any)*

Text for which the QR Code will be generated.

##### W40.2.2. Error correction *Enum*

The error correction level in a QR Code symbol, possible options:

- Low – The QR Code can tolerate about 7% erroneous codewords.
- Medium – The QR Code can tolerate about 15% erroneous codewords.
- Quartile – The QR Code can tolerate about 25% erroneous codewords.
- High – The QR Code can tolerate about 30% erroneous codewords.

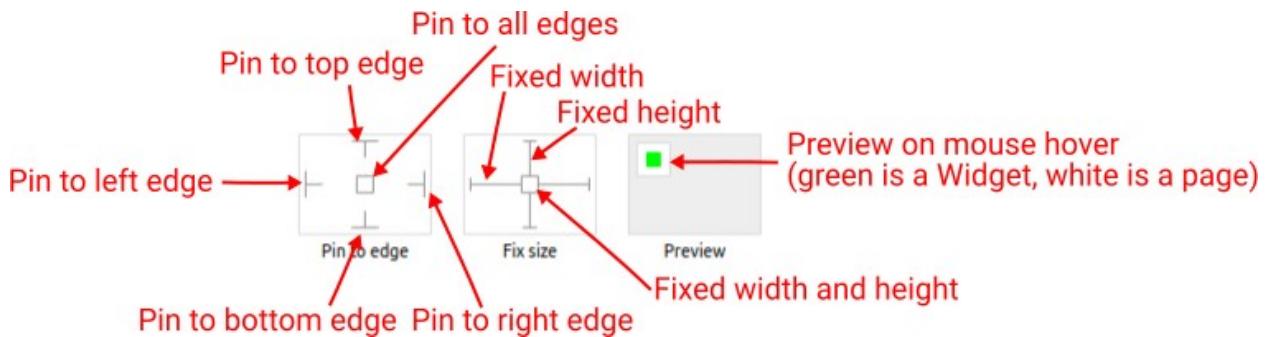

##### W40.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W40.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

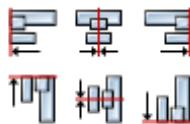

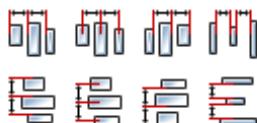

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W40.2.5. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W40.2.6. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W40.2.7. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W40.2.8. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W40.2.9. Width** *Number*

The width of the component. It is set in pixels.

**W40.2.10. Height** *Number*

The height of the component. It is set in pixels.

**W40.2.11. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W40.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style**

**W40.2.13. Default Object**

Style used when rendering of the Widget.

**Events****W40.2.14. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W40.2.15. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

**W40.2.16. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

**W40.2.17. Catch error Boolean**

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W40.3. Examples**

- *Dashboard Widgets Demo*

## W41.1. Description

Renders a QR Code representing the given text string at the given error correction level.

## W41.2. Properties

### Specific

#### W41.2.1. Text *EXPRESSION (any)*

Text for which the QR Code will be generated.

#### W41.2.2. Error correction *Enum*

The error correction level in a QR Code symbol, possible options:

- Low – The QR Code can tolerate about 7% erroneous codewords.
- Medium – The QR Code can tolerate about 15% erroneous codewords.
- Quartile – The QR Code can tolerate about 25% erroneous codewords.
- High – The QR Code can tolerate about 30% erroneous codewords.

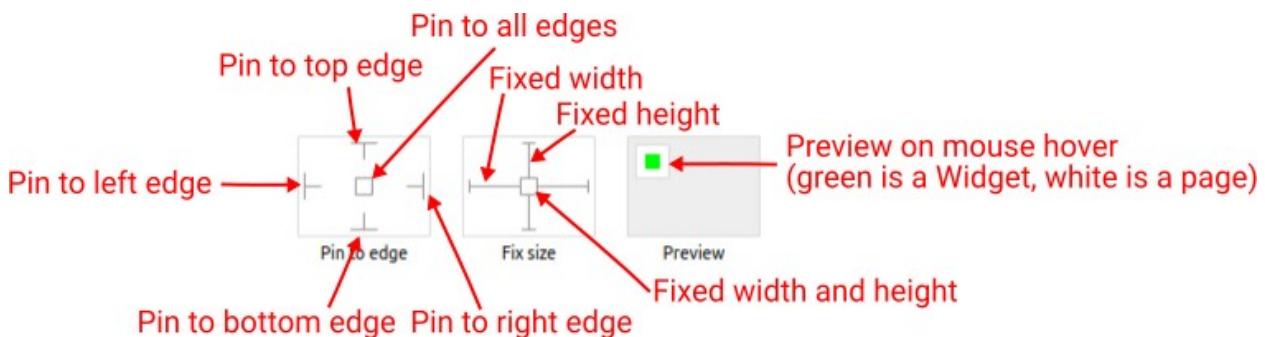

#### W41.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

### Position and size

#### W41.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

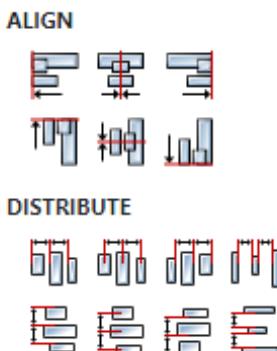

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W41.2.5. Hide "Widget is outside of its parent" warning** *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W41.2.6. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W41.2.7. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W41.2.8. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W41.2.9. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W41.2.10. Width** *Number*

The width of the component. It is set in pixels.

**W41.2.11. Height** *Number*

The height of the component. It is set in pixels.

**W41.2.12. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W41.2.13. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### W41.2.14. Default Object

Style used when rendering of the Widget.

## Events

### W41.2.15. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W41.2.16. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W41.2.17. Outputs Array

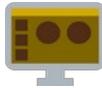

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W41.2.18. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W41.3. Examples

- [eez-gui-widgets-demo](#)

### W42.1. Description

Radio Widget is used in radio groups — collections of radio buttons describing a set of related options. Only one radio in a given group can be selected at the same time. In group, each radio has different `Value` property and the same `Group variable` property.

### W42.2. Properties

#### Specific

##### W42.2.1. Label *EXPRESSION (string)*

Label displayed next to the radio widget.

##### W42.2.2. Group variable *ASSIGNABLE EXPRESSION (any)*

Variable in which value from `Value` property is stored when this radio widget is selected.

##### W42.2.3. Value *EXPRESSION (any)*

Value which will be stored in `Group variable` when this radio widget is selected. Also, by comparing this value with the `Group variable` it is decided if this radio widget is selected or not.

##### W42.2.4. Enabled *EXPRESSION (any)*

If it is true, then the radio is enabled, otherwise it will be disabled.

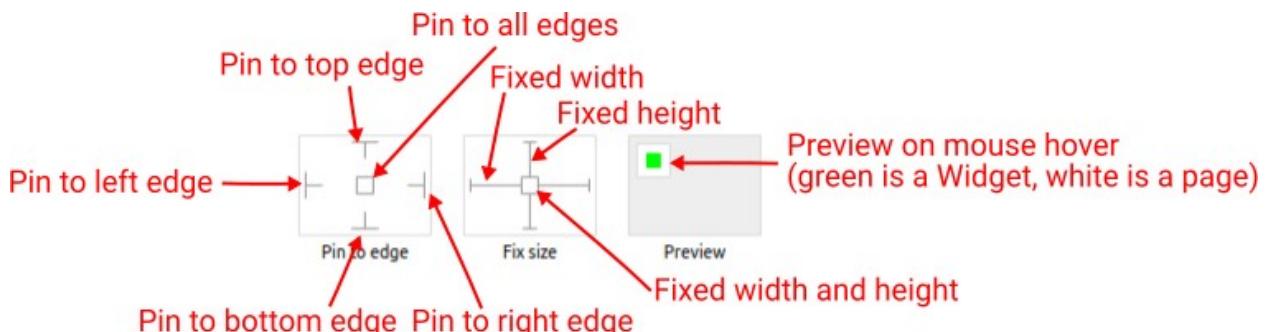

##### W42.2.5. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W42.2.6. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

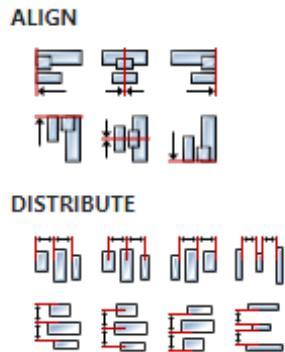

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the

width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### **W42.2.7. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W42.2.8. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W42.2.9. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the *Top*, *Width* and *Height* properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use *+*, *-*, *\** and */* operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

#### **W42.2.10. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W42.2.11. Width Number**

The width of the component. It is set in pixels.

#### **W42.2.12. Height Number**

The height of the component. It is set in pixels.

#### **W42.2.13. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## **Layout**

#### **W42.2.14. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W42.2.15. Default Object

Style used when rendering of the Widget.

## Events

### W42.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W42.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W42.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

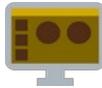

### W42.2.19. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W42.3. Examples

- *Dashboard Widgets Demo*

## W43. Rectangle (Dashboard)

### W43.1. Description

This Widget renders a solid rectangle using the background color from the `Default` style. It can also be used to render horizontal (if height is 1 pixel) and vertical lines (if width is 1 pixel).

### W43.2. Properties

#### Specific

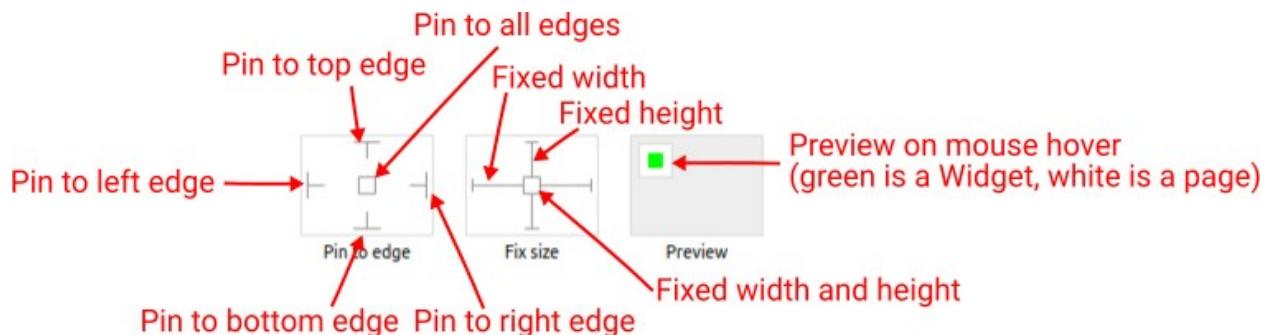

##### W43.2.1. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W43.2.2. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

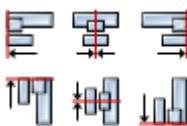

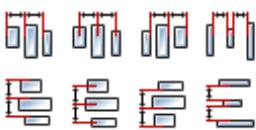

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W43.2.3. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W43.2.4. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W43.2.5. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W43.2.6. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W43.2.7. Width Number**

The width of the component. It is set in pixels.

**W43.2.8. Height Number**

The height of the component. It is set in pixels.

**W43.2.9. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W43.2.10. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W43.2.11. Default Object**

Style used when rendering the background of the Widget.

## Events

### W43.2.12. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W43.2.13. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W43.2.14. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W43.2.15. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W43.3. Examples

- Dashboard Widgets Demo

## W44. Rectangle (EEZ-GUI)

### W44.1. Description

This Widget renders a solid rectangle using the background color from the `Default` style. It can also be used to render horizontal (if height is 1 pixel) and vertical lines (if width is 1 pixel).

### W44.2. Properties

#### Specific

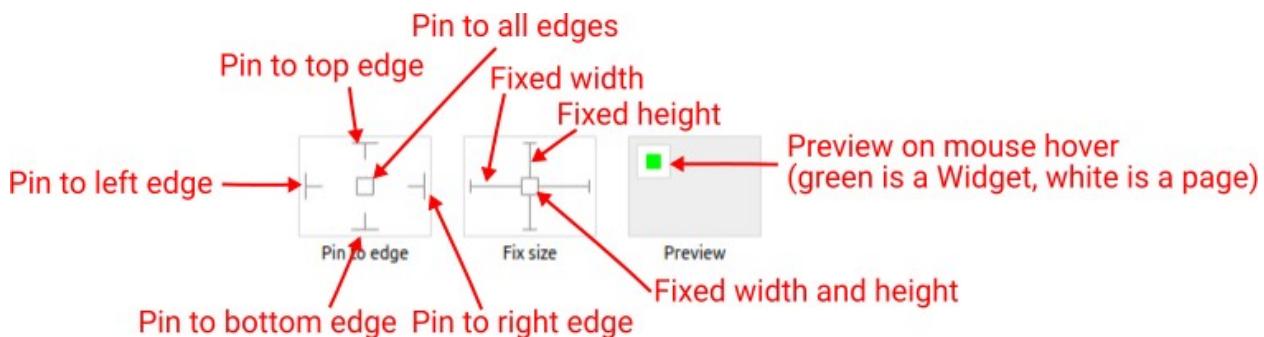

##### W44.2.1. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W44.2.2. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

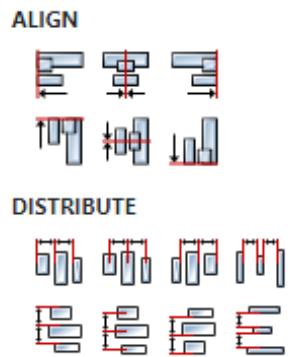

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W44.2.3. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

##### W44.2.4. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W44.2.5. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W44.2.6. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W44.2.7. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W44.2.8. Width Number**

The width of the component. It is set in pixels.

**W44.2.9. Height Number**

The height of the component. It is set in pixels.

**W44.2.10. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W44.2.11. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to Docking Manager, use this property to set the title of the tab that contains this widget.

**Style****W44.2.12. Default Object**

Style used when rendering the background of the Widget.

## Events

### W44.2.13. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W44.2.14. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W44.2.15. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

### W44.2.16. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W45. Roller (EEZ-GUI)

### W45.1. Description

This Widget allows us to select one option from a list using touch based scrolling.

### W45.2. Properties

#### Specific

##### W45.2.1. Data *EXPRESSION (integer)*

The variable in which the selected value in the range of [Min, Max] is saved.

##### W45.2.2. Min *EXPRESSION (any)*

The minimum value that can be selected.

##### W45.2.3. Max *EXPRESSION (any)*

The maximum value that can be selected.

##### W45.2.4. Text *EXPRESSION (any)*

The text that is displayed in the widget for each possible value that is selected.

Example: set Data to selected\_option (of type integer), set Min to 0, and Max to Array.length(TEXTS) - 1, where TEXTS is a variable of type array:string with Default value set to: ["Option 1", "Option 2", "Option 3", ...] and then we can set this property to TEXTS[selected\_option].

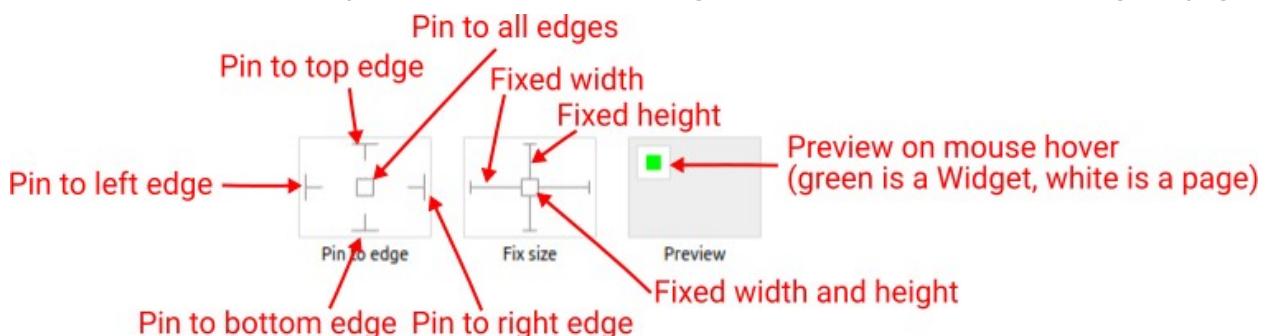

##### W45.2.5. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W45.2.6. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

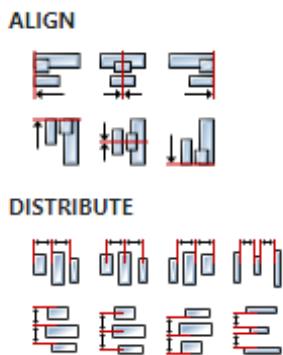

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### **W45.2.7. Hide "Widget is outside of its parent" warning   Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

#### **W45.2.8. Align and distribute   Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W45.2.9. Center widget   Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W45.2.10. Left   Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### **W45.2.11. Top   Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W45.2.12. Width   Number**

The width of the component. It is set in pixels.

#### **W45.2.13. Height   Number**

The height of the component. It is set in pixels.

#### **W45.2.14. Absolute position   String**

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### W45.2.15. Tab title *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### W45.2.16. Default *Object*

Style used when rendering the background of the Widget.

### W45.2.17. Selected value *Object*

Style used to render selected value.

### W45.2.18. Unselected value *Object*

Style used to render other (unselected) values.

## Events

### W45.2.19. Event handlers *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W45.2.20. Inputs *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W45.2.21. Outputs *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### W45.2.22. Catch error *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error

occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### ***W45.3. Inputs***

#### ***W45.3.1. clear    SEQ / OPTIONAL***

We need to send a signal to this input if we want to reset the selection, i.e. choose the first option.

### ***W45.4. Examples***

- *eez-gui-widgets-demo*

## W46. Roller (LVGL)

### W46.1. Description

This Widget allows us to select one option from a list using touch based scrolling.  
More info ([link](#))

### W46.2. Properties

#### Specific

##### W46.2.1. Options *EXPRESSION (array:string)*

List of options.

##### W46.2.2. Options type *Enum*

Select between Literal and Expression. If Literal is selected then Options are entered one option per line. If Expression is selected then options are evaluated from Options expression which must be of type array:string.

##### W46.2.3. Selected *EXPRESSION (integer)*

The zero-based index of the selected option.

##### W46.2.4. Selected type *Enum*

Select between Literal and Assignable. If Assignable is selected then Options can be variable in which the zero-based index of the selected option will be stored.

##### W46.2.5. Mode *Enum*

Roller mode options:

- NORMAL – normal roller.
- INFINITE – makes the roller circular.

#### General

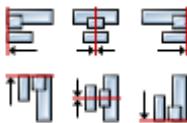

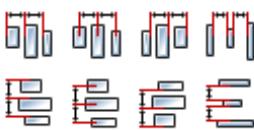

##### W46.2.6. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W46.2.7. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W46.2.8. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W46.2.9. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W46.2.10. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W46.2.11. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W46.2.12. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W46.2.13. Width Number**

The width of the component. It is set in pixels.

**W46.2.14. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W46.2.15. Height** *Number*

The height of the component. It is set in pixels.

**W46.2.16. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W46.2.17. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W46.2.18. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W46.2.19. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W46.2.20. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W46.2.21. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W46.2.22. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W46.2.23. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W46.2.24. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W46.2.25. Scrollable** *Boolean*

Make the object scrollable.

**W46.2.26. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W46.2.27. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W46.2.28. Scroll one Boolean**

Allow scrolling only one snappable children.

**W46.2.29. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W46.2.30. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W46.2.31. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W46.2.32. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W46.2.33. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W46.2.34. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W46.2.35. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W46.2.36. Event bubble Boolean**

Propagate the events to the parent too.

**W46.2.37. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W46.2.38. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W46.2.39. Ignore layout Boolean**

Make the object positionable by the layouts.

**W46.2.40. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W46.2.41. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W46.2.42. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W46.2.43. Checked state type** *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W46.2.44. Disabled** *EXPRESSION (boolean)*

Disabled state

#### **W46.2.45. Disabled state type** *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W46.2.46. Focused** *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W46.2.47. Pressed** *Boolean*

Being pressed.

### Events

#### **W46.2.48. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### Flow

#### **W46.2.49. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W46.2.50. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W46.2.51. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

put. The data that will be passed through that output is the textual description of the error.

### ***W46.3. Examples***

- *LVGL Widgets Demo*

## W47. Scale

### W47.1. Description

Scale allows you to have a linear scale with ranges and sections with custom styling.  
More info ([link](#))

### W47.2. Properties

#### Specific

##### W47.2.1. Scale mode    *Enum*

Defines position and orientation of the scale.

##### W47.2.2. Minor range    *Number*

Set the smallest tick value.

##### W47.2.3. Major range    *Number*

Set the largest tick value.

##### W47.2.4. Total tick count    *Number*

Set the number of total ticks.

##### W47.2.5. Major tick every    *Number*

Configure the major tick being every Nth ticks.

##### W47.2.6. Show labels    *Boolean*

Set to true if labels should be drawn.

#### General

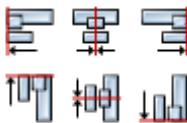

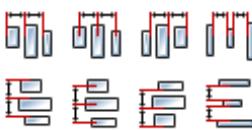

##### W47.2.7. Name    *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W47.2.8. Align and distribute    *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W47.2.9. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W47.2.10. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W47.2.11. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W47.2.12. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W47.2.13. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W47.2.14. Width Number**

The width of the component. It is set in pixels.

**W47.2.15. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W47.2.16. Height** *Number*

The height of the component. It is set in pixels.

**W47.2.17. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W47.2.18. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W47.2.19. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W47.2.20. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W47.2.21. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W47.2.22. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W47.2.23. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W47.2.24. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W47.2.25. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W47.2.26. Scrollable** *Boolean*

Make the object scrollable.

**W47.2.27. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W47.2.28. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W47.2.29. Scroll one Boolean**

Allow scrolling only one snappable children.

**W47.2.30. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W47.2.31. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W47.2.32. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W47.2.33. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W47.2.34. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W47.2.35. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W47.2.36. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W47.2.37. Event bubble Boolean**

Propagate the events to the parent too.

**W47.2.38. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W47.2.39. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W47.2.40. Ignore layout Boolean**

Make the object positionable by the layouts.

**W47.2.41. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W47.2.42. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W47.2.43. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W47.2.44. Checked state type    *Enum***

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W47.2.45. Disabled    *EXPRESSION (boolean)***

Disabled state

#### **W47.2.46. Disabled state type    *Enum***

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W47.2.47. Focused    *Boolean***

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W47.2.48. Pressed    *Boolean***

Being pressed.

### **Events**

#### **W47.2.49. Event handlers    *Array***

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### **Flow**

#### **W47.2.50. Inputs    *Array***

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W47.2.51. Outputs    *Array***

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

#### **W47.2.52. Catch error    *Boolean***

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that out-

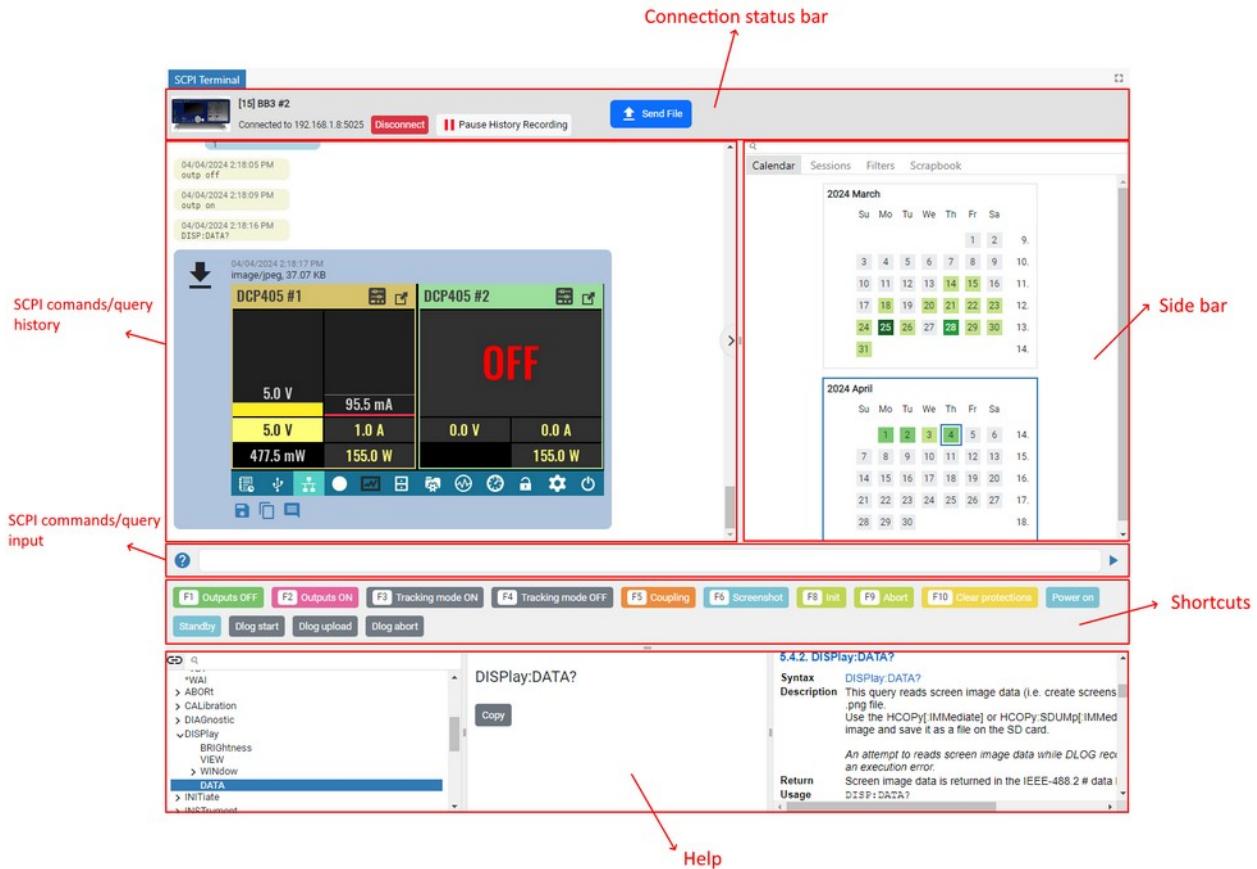

put. The data that will be passed through that output is the textual description of the error.

## W48. SCPI Terminal

### W48.1. Description

This widget allows interaction with the instrument based on the SCPI specification. It consists of several parts, some of them can be hidden with associated properties.

### W48.2. Properties

#### Specific

##### W48.2.1. Instrument *EXPRESSION (object:Instrument)*

Selected instrument object.

##### W48.2.2. Show connection status bar *EXPRESSION (boolean)*

Show/Hide instrument connection status bar.

##### W48.2.3. Show shortcuts *EXPRESSION (boolean)*

Show/Hide shortctus panel.

##### W48.2.4. Show help *EXPRESSION (boolean)*

Show/Hide SCPI commands help panel.

##### W48.2.5. Show side bar *EXPRESSION (boolean)*

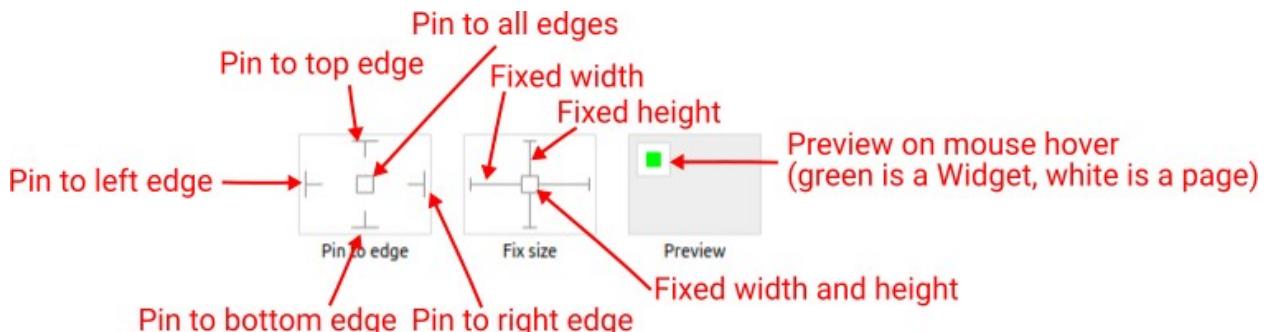

Show/Hide side bar with history search options.

**W48.2.6. Visible EXPRESSION (boolean)**

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

**Position and size****W48.2.7. Resizing Any**

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

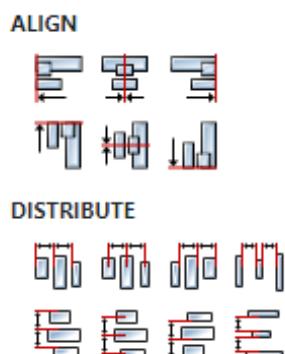

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W48.2.8. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W48.2.9. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W48.2.10. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

#### **W48.2.11. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W48.2.12. Width Number**

The width of the component. It is set in pixels.

#### **W48.2.13. Height Number**

The height of the component. It is set in pixels.

#### **W48.2.14. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

### Layout

#### **W48.2.15. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

### Events

#### **W48.2.16. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### Flow

#### **W48.2.17. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive addi-

tional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

#### **W48.2.18. Outputs    Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

#### **W48.2.19. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W48.3. Examples**

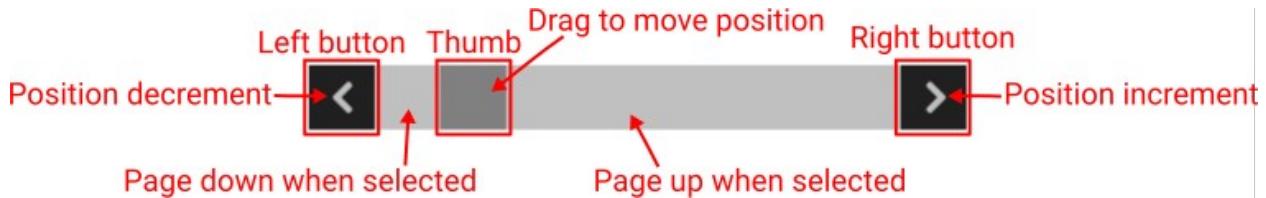

- BB3 SCPI Terminal and Dashboard

## W49. ScrollBar

### W49.1. Description

This Widget can be used with `List` and `Grid` Widget for scrolling within large lists that do not fit entirely within said Widgets. If `width > height` then a horizontal `ScrollBar` is displayed:

... and if `width <= height` then a vertical `ScrollBar` is displayed.

The horizontal `ScrollBar` has left and right buttons, and the vertical top and bottom buttons.

This Widget connects to the `List` or `Grid` Widget via a variable of type `struct:$ScrollbarState` which is set in the `Data` property. The structure `struct:$ScrollbarState` has these fields:

- `numItems` – how many items/elements are in the list
- `itemsPerPage` – how many items fit inside the `List` or `Grid` Widget.
- `positionIncrement` – determines how many items we will move within the list when the left/top button (shift to the left/up) or the right/bottom button (shift to the right/down) is selected.
- `position` – the position of the first item/element that is rendered in the list. So within the `List` or `Grid` Widget, items from `position` to `position + itemsPerPage` will be rendered. `position` can be in the interval from `0` to `numItems - itemsPerPage`.

The scrollbar can change its 'position' in the following ways:

- By selecting the Left/Top button `position` is decreased by the `positionIncrement` value.
- By selecting Right/Bottom button `position` is increased by `positionIncrement` value.
- By moving the thumb `position` is set to a value in the interval from `0` to `numItems - itemsPerPage`.
- If the region between the Left/Top button and the thumb is selected, then the position is

- reduced by `itemsPerPage` (AKA "page up").
- If the region between the thumb and the Right/Bottom button is selected, then the position is increased by `itemsPerPage` (AKA "page down").

## W49.2. Properties

### Specific

#### W49.2.1. Data *EXPRESSION (struct:\$ScrollbarState)*

Set here the name of the `struct:$ScrollbarState` type variable.

#### W49.2.2. Left button text *String*

The text that will be displayed inside the left/top button. Usually a single character from an icons font is used.

#### W49.2.3. Right button text *String*

The text that will be displayed inside the right/bottom button. Usually a single character from an icons font is used.

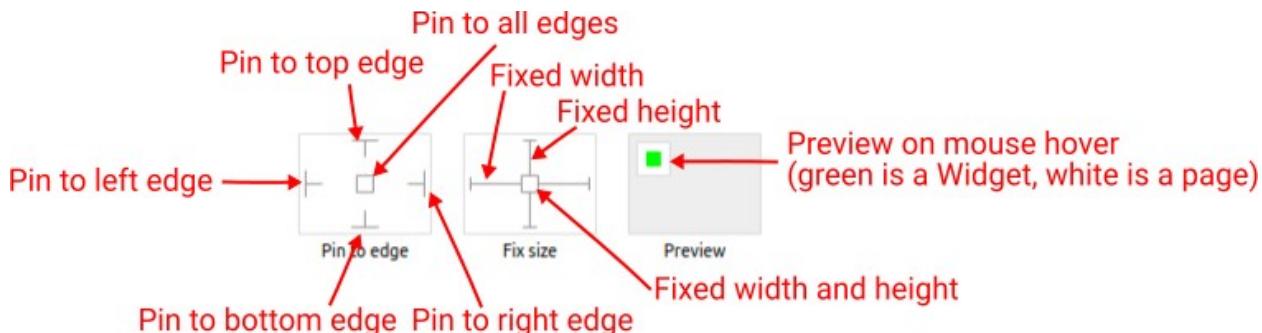

#### W49.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

### Position and size

#### W49.2.5. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

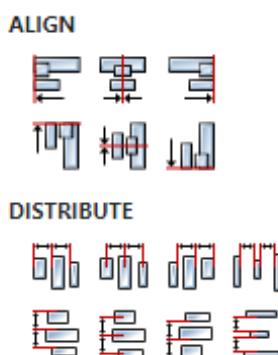

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W49.2.6. Hide "Widget is outside of its parent" warning** Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W49.2.7. Align and distribute** Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W49.2.8. Center widget** Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W49.2.9. Left** Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W49.2.10. Top** Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W49.2.11. Width** Number

The width of the component. It is set in pixels.

**W49.2.12. Height** Number

The height of the component. It is set in pixels.

**W49.2.13. Absolute position** String

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W49.2.14. Tab title** EXPRESSION (string)

If this widget is a child of a container with layout set to Docking Manager, use this property to set

the title of the tab that contains this widget.

## Style

### **W49.2.15. Default Object**

Style used when rendering the background of the Widget.

### **W49.2.16. Thumb Object**

Style that will be used to render the scrollbar thumb.

### **W49.2.17. Buttons Object**

Style used to render the left and right buttons.

## Events

### **W49.2.18. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### **W49.2.19. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### **W49.2.20. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### **W49.2.21. Catch error Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W49.3. Examples**

- *eez-gui-widgets-demo*

## W50. Select

### W50.1. Description

This Widget, similar to `Container`, has multiple Child widgets under it. But unlike `Container`, which will always display all Child widgets, this Widget displays only one Child widget, and that is the one we selected via the `Data` property. Therefore, use this Widget when you want depending on e.g. the value of some variable to change the structure of the page. Widgets are added to `Select` via the *Widgets Structure* panel using drag and drop.

### W50.2. Properties

#### Specific

##### W50.2.1. Data EXPRESSION (boolean)

The result of the evaluation of this expression must be the zero based index of the Widget that is to be displayed. So if the result is 0 then the first Widget will be displayed, if the result is 1 then the second Widget will be displayed, etc. The order of Widgets can be selected using drag and drop within the *Widgets Structure* panel.

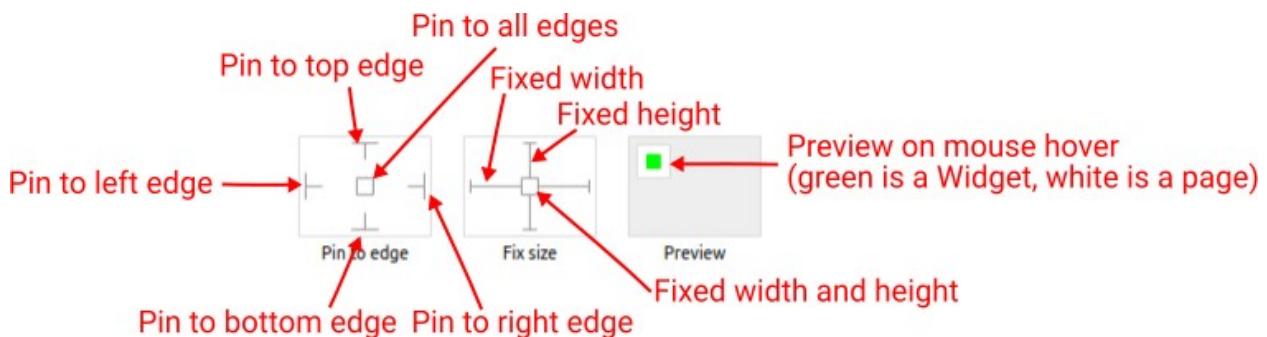

##### W50.2.2. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W50.2.3. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

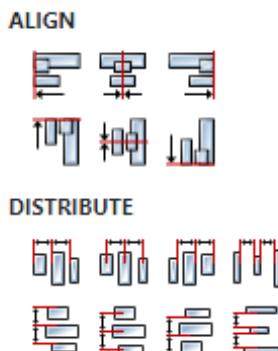

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W50.2.4. Hide "Widget is outside of its parent" warning** *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W50.2.5. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W50.2.6. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W50.2.7. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W50.2.8. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W50.2.9. Width** *Number*

The width of the component. It is set in pixels.

**W50.2.10. Height** *Number*

The height of the component. It is set in pixels.

**W50.2.11. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W50.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### W50.2.13. Default Object

Style used when rendering the background of the Widget.

## Events

### W50.2.14. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W50.2.15. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W50.2.16. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

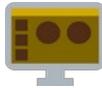

### W50.2.17. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W50.3. Examples

- [eez-gui-widgets-demo](#)

## W51. Slider (Dashboard)

### W51.1. Description

This Widget allows us to select one value from the list by moving the knob on the slider.

### W51.2. Properties

#### Specific

##### W51.2.1. Value *EXPRESSION (double)*

The variable in which the selected value in the range of [Min, Max] is saved.

##### W51.2.2. Min *EXPRESSION (double)*

The minimum value that can be selected.

##### W51.2.3. Max *EXPRESSION (double)*

The maximum value that can be selected.

##### W51.2.4. Step *EXPRESSION (double)*

The step is a number that specifies the granularity that the value must adhere to.

##### W51.2.5. View min *EXPRESSION (double)*

The minimum value that is displayed.

##### W51.2.6. View max *EXPRESSION (double)*

The maximum value that is displayed.

##### W51.2.7. Enabled *EXPRESSION (any)*

If it is true, then the slider is enabled, otherwise it will be disabled.

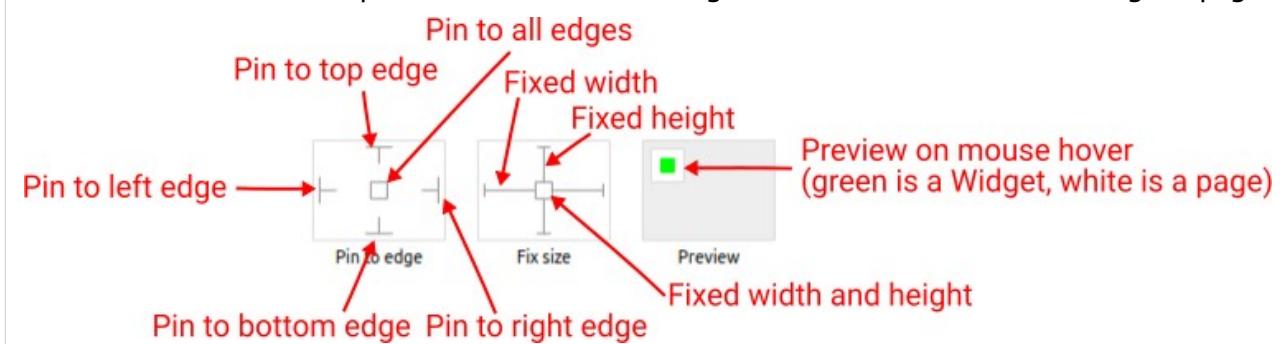

##### W51.2.8. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W51.2.9. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

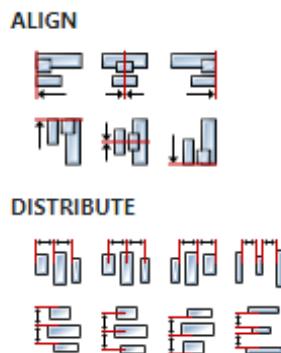

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W51.2.10. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W51.2.11. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W51.2.12. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the *Top*, *Width* and *Height* properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use *+*, *-*, *\** and */* operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### W51.2.13. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W51.2.14. Width Number

The width of the component. It is set in pixels.

### W51.2.15. Height Number

The height of the component. It is set in pixels.

**W51.2.16. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W51.2.17. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W51.2.18. Default** *Object*

Style used when rendering of the Widget.

**Events****W51.2.19. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W51.2.20. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W51.2.21. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W51.2.22. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### **W51.3. Examples**

- *Dashboard Widgets Demo*

## W52. Slider (EEZ-GUI)

### W52.1. Description

This Widget allows us to select one value from the list by moving the knob on the slider.

### W52.2. Properties

#### Specific

##### W52.2.1. Data *EXPRESSION (integer)*

The variable in which the selected value in the range of [Min, Max] is saved.

##### W52.2.2. Min *EXPRESSION (any)*

The minimum value that can be selected.

##### W52.2.3. Max *EXPRESSION (any)*

The maximum value that can be selected.

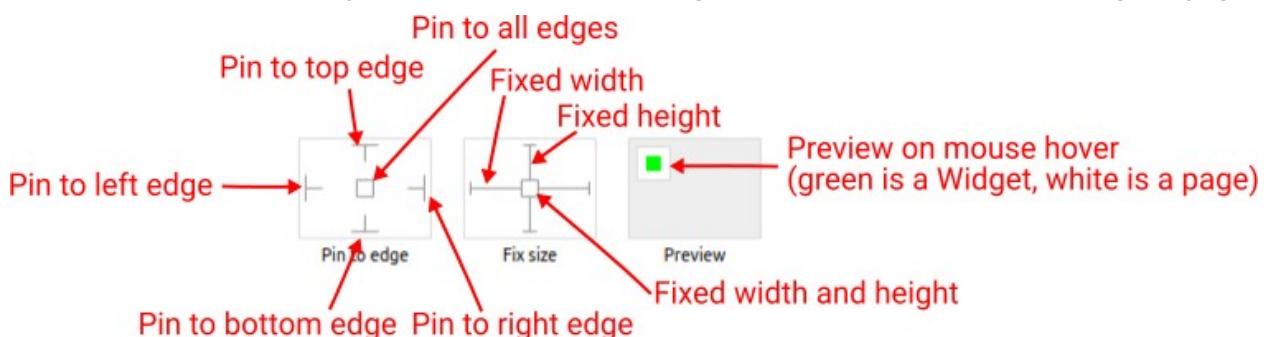

##### W52.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W52.2.5. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

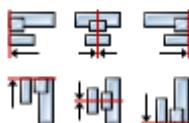

**W52.2.6. Hide "Widget is outside of its parent" warning** *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

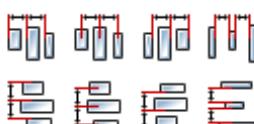

**W52.2.7. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

ALIGN

DISTRIBUTE

**W52.2.8. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W52.2.9. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W52.2.10. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W52.2.11. Width** *Number*

The width of the component. It is set in pixels.

**W52.2.12. Height** *Number*

The height of the component. It is set in pixels.

**W52.2.13. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W52.2.14. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### W52.2.15. Default Object

Style used when rendering of the Widget.

## Events

### W52.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- Event – Event that is processed, e.g. CLICKED.
- Handler type – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- Action - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W52.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W52.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W52.2.19. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W52.3. Examples

- eez-gui-widgets-demo

## W53. Slider (LVGL)

### W53.1. Description

This Widget allows us to select one or two values from the list by moving the knob on the slider.  
More info ([link](#))

### W53.2. Properties

#### Specific

##### W53.2.1. Min *Number*

The minimum value that can be selected.

##### W53.2.2. Max *Number*

The maximum value that can be selected.

##### W53.2.3. Mode *Enum*

Slider mode options:

- `NORMAL` – A normal slider.
- `SYMMETRICAL` – Draw the indicator form the zero value to current value. Requires negative minimum range and positive maximum range.
- `RANGE` – Allows setting the start value (`Value left` property) and end value (`Value` property).

##### W53.2.4. Value *EXPRESSION (integer)*

The selected value on the slider. If `RANGE` mode is selected then this is selected end value on the slider.

##### W53.2.5. Value type *Enum*

Select between `Literal` and `Assignable`. If `Assignable` is selected then `Value` can be variable in which the selected value will be stored.

##### W53.2.6. Value left *EXPRESSION (integer)*

If `RANGE` mode is selected then this is selected start value on the slider.

##### W53.2.7. Value left type *Enum*

Select between `Literal` and `Assignable`. If `Assignable` is selected then `Value left` can be variable in which the selected start value will be stored.

#### General

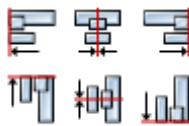

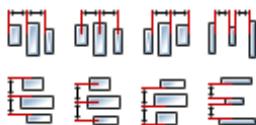

##### W53.2.8. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

**W53.2.9. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W53.2.10. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W53.2.11. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W53.2.12. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W53.2.13. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W53.2.14. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W53.2.15. Width Number**

The width of the component. It is set in pixels.

**W53.2.16. Width unit Enum**

The following options are available:

- px – Width is given in pixels.

- Width is given as a percentage in relation to the parent width.
- Width is automatically set to fit the entire content in width.

**W53.2.17. Height** *Number*

The height of the component. It is set in pixels.

**W53.2.18. Height unit** *Enum*

The following options are available:

- Height is given in pixels.
- Height is given as a percentage in relation to the parent height.
- Height is automatically set to fit the entire content in height.

**Layout****W53.2.19. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W53.2.20. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W53.2.21. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W53.2.22. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W53.2.23. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W53.2.24. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W53.2.25. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W53.2.26. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W53.2.27. Scrollable** *Boolean*

Make the object scrollable.

**W53.2.28. Scroll elastic    Boolean**

Allow scrolling inside but with slower speed.

**W53.2.29. Scroll momentum    Boolean**

Make the object scroll further when "thrown".

**W53.2.30. Scroll one    Boolean**

Allow scrolling only one snappable children.

**W53.2.31. Scroll chain hor    Boolean**

Allow propagating the horizontal scroll to a parent.

**W53.2.32. Scroll chain ver    Boolean**

Allow propagating the vertical scroll to a parent.

**W53.2.33. Scroll chain    Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W53.2.34. Scroll on focus    Boolean**

Automatically scroll object to make it visible when focused.

**W53.2.35. Scroll with arrow    Boolean**

Allow scrolling the focused object with arrow keys.

**W53.2.36. Snappable    Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W53.2.37. Press lock    Boolean**

Keep the object pressed even if the press slid from the object.

**W53.2.38. Event bubble    Boolean**

Propagate the events to the parent too.

**W53.2.39. Gesture bubble    Boolean**

Propagate the gestures to the parent.

**W53.2.40. Adv hittest    Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W53.2.41. Ignore layout    Boolean**

Make the object positionable by the layouts.

**W53.2.42. Floating    Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W53.2.43. Overflow visible    Boolean**

Do not clip the children's content to the parent's boundary.

## States

### W53.2.44. Checked EXPRESSION (boolean)

Toggled or checked state.

### W53.2.45. Checked state type Enum

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

### W53.2.46. Disabled EXPRESSION (boolean)

Disabled state

### W53.2.47. Disabled state type Enum

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

### W53.2.48. Focused Boolean

Focused via keypad or encoder or clicked via touchpad/mouse.

### W53.2.49. Pressed Boolean

Being pressed.

## Events

### W53.2.50. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W53.2.51. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W53.2.52. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

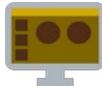

#### **W53.2.53. Catch error    Boolean**

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

#### **W53.3. Examples**

- *Dashboard Widgets Demo*

## W54. Spinner (Dashboard)

### W54.1. Description

We use this Widget to show that some operation is in progress or something is loading, etc.

### W54.2. Properties

#### Specific

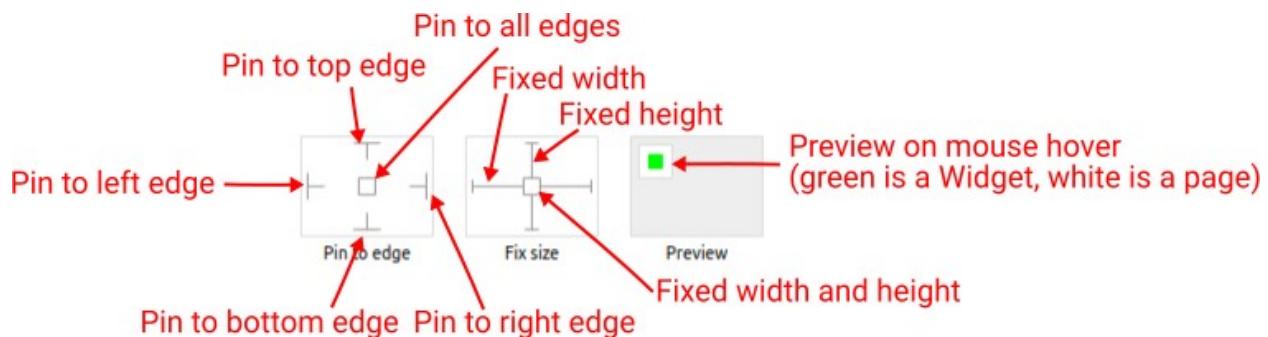

##### W54.2.1. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W54.2.2. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

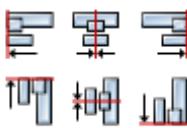

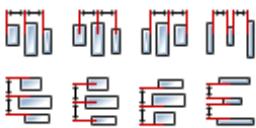

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W54.2.3. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W54.2.4. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W54.2.5. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \* and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W54.2.6. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W54.2.7. Width Number**

The width of the component. It is set in pixels.

**W54.2.8. Height Number**

The height of the component. It is set in pixels.

**W54.2.9. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W54.2.10. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to Docking Manager, use this property to set the title of the tab that contains this widget.

**Style****W54.2.11. Default Object**

Style used when rendering of the Widget.

## Events

### W54.2.12. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W54.2.13. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W54.2.14. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W54.2.15. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W54.3. Examples

- Dashboard Widgets Demo

## W55. Spinner (LVGL)

### W55.1. Description

Use this Widget to show that some operation is in progress or something is loading, etc.

### W55.2. Properties

#### General

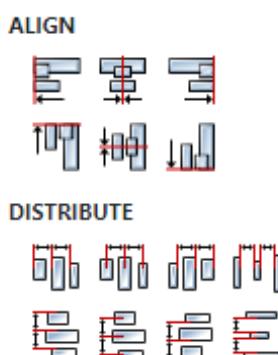

##### W55.2.1. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W55.2.2. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W55.2.3. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

##### W55.2.4. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

##### W55.2.5. Left unit *Enum*

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W55.2.6. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W55.2.7. Top unit** *Enum*

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

**W55.2.8. Width** *Number*

The width of the component. It is set in pixels.

**W55.2.9. Width unit** *Enum*

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

**W55.2.10. Height** *Number*

The height of the component. It is set in pixels.

**W55.2.11. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W55.2.12. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W55.2.13. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W55.2.14. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W55.2.15. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W55.2.16. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W55.2.17. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W55.2.18. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W55.2.19. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W55.2.20. Scrollable** *Boolean*

Make the object scrollable.

**W55.2.21. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W55.2.22. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W55.2.23. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W55.2.24. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W55.2.25. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W55.2.26. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W55.2.27. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W55.2.28. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W55.2.29. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W55.2.30. Press lock** *Boolean*

Keep the object pressed even if the press slid from the object.

**W55.2.31. Event bubble** *Boolean*

Propagate the events to the parent too.

**W55.2.32. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W55.2.33. Adv hit test Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W55.2.34. Ignore layout Boolean**

Make the object positionable by the layouts.

**W55.2.35. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W55.2.36. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W55.2.37. Checked EXPRESSION (boolean)**

Toggled or checked state.

**W55.2.38. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W55.2.39. Disabled EXPRESSION (boolean)**

Disabled state

**W55.2.40. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W55.2.41. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W55.2.42. Pressed Boolean**

Being pressed.

**Events****W55.2.43. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.

- Action - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### **W55.2.44. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### **W55.2.45. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### **W55.2.46. Catch error Boolean**

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## **W55.3. Examples**

- Dashboard Widgets Demo

## W56. Switch (Dashboard)

### W56.1. Description

Switch Widget is used when we want a turn ON or turn OFF option.

### W56.2. Properties

#### Specific

##### W56.2.1. Value *EXPRESSION (any)*

Boolean variable in which `true` is stored when the switch is ON and `false` when the switch is OFF.

##### W56.2.2. Enabled *EXPRESSION (any)*

If it is true, then the switch is enabled, otherwise it will be disabled.

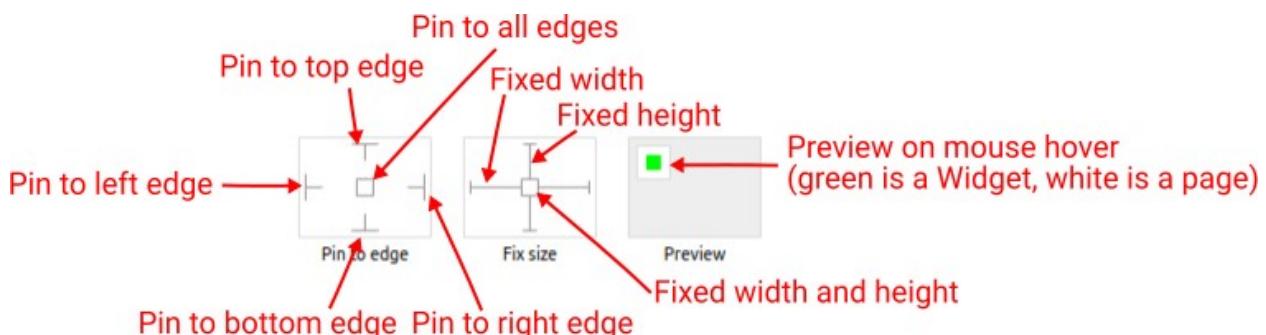

##### W56.2.3. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W56.2.4. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

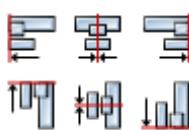

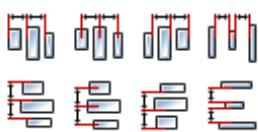

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W56.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W56.2.6. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W56.2.7. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W56.2.8. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W56.2.9. Width Number**

The width of the component. It is set in pixels.

**W56.2.10. Height Number**

The height of the component. It is set in pixels.

**W56.2.11. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W56.2.12. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W56.2.13. Default Object**

Style used when rendering of the Widget.

## Events

### W56.2.14. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W56.2.15. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W56.2.16. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W56.2.17. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W56.3. Examples

- Dashboard Widgets Demo

## W57. Switch (EEZ-GUI)

### W57.1. Description

Checkbox Widget is used when we want a turn ON or turn OFF option.

### W57.2. Properties

#### Specific

##### W57.2.1. Data EXPRESSION (boolean)

Boolean variable in which `true` is stored when the switch is ON and `false` when the switch is OFF.

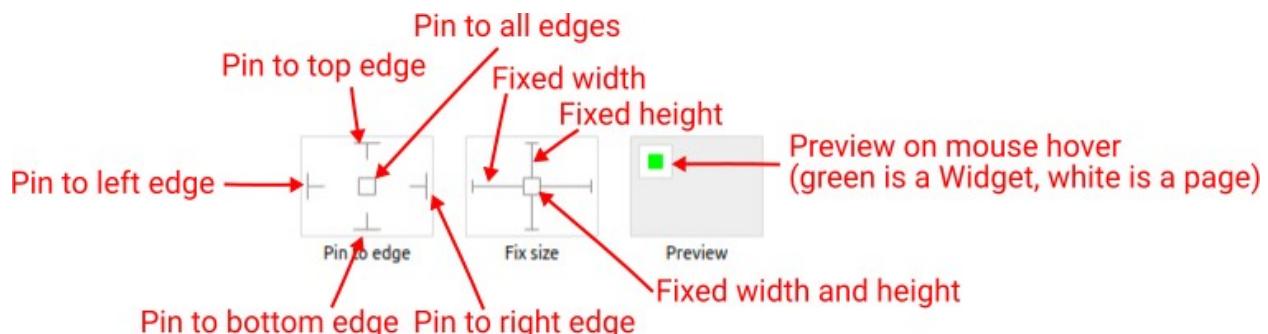

##### W57.2.2. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W57.2.3. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

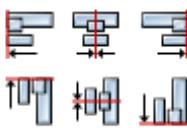

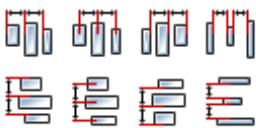

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W57.2.4. Hide "Widget is outside of its parent" warning Boolean

Check when we want to hide "Widget is outside of its parent" warning message(s).

##### W57.2.5. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W57.2.6. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W57.2.7. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

**W57.2.8. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W57.2.9. Width Number**

The width of the component. It is set in pixels.

**W57.2.10. Height Number**

The height of the component. It is set in pixels.

**W57.2.11. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W57.2.12. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W57.2.13. Default Object**

Style used when rendering of the Widget.

## Events

### W57.2.14. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W57.2.15. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W57.2.16. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W57.2.17. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W57.3. Examples

- [eez-gui-widgets-demo](#)

## W58. Switch (LVGL)

### W58.1. Description

Switch Widget is used when we want a turn ON or turn OFF option.  
More info ([link](#))

### W58.2. Properties

#### General

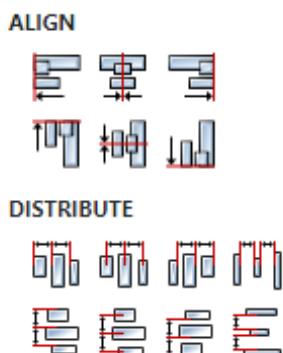

##### W58.2.1. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

#### Position and size

##### W58.2.2. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

##### W58.2.3. Center widget *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

##### W58.2.4. Left *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

##### W58.2.5. Left unit *Enum*

The following options are available:

- px – Left is default in pixels.

- `%` – Left is set as a percentage in relation to the parent width.

### **W58.2.6. Top *Number***

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W58.2.7. Top unit *Enum***

The following options are available:

- `px` – Top is set in pixels.
- `%` – The top is set as a percentage in relation to the parent height.

### **W58.2.8. Width *Number***

The width of the component. It is set in pixels.

### **W58.2.9. Width unit *Enum***

The following options are available:

- `px` – Width is given in pixels.
- `%` – Width is given as a percentage in relation to the parent width.
- `content` – Width is automatically set to fit the entire content in width.

### **W58.2.10. Height *Number***

The height of the component. It is set in pixels.

### **W58.2.11. Height unit *Enum***

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

## Layout

### **W58.2.12. Tab title *EXPRESSION (string)***

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

### **W58.2.13. Use style *ObjectReference***

Here we can select one of the globally defined Styles so that the Widget uses that Style.

## Flags

### **W58.2.14. Hidden *EXPRESSION (boolean)***

Make the object hidden.

### **W58.2.15. Hidden flag type *Enum***

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W58.2.16. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W58.2.17. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W58.2.18. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W58.2.19. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W58.2.20. Scrollable** *Boolean*

Make the object scrollable.

**W58.2.21. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W58.2.22. Scroll momentum** *Boolean*

Make the object scroll further when "thrown".

**W58.2.23. Scroll one** *Boolean*

Allow scrolling only one snappable children.

**W58.2.24. Scroll chain hor** *Boolean*

Allow propagating the horizontal scroll to a parent.

**W58.2.25. Scroll chain ver** *Boolean*

Allow propagating the vertical scroll to a parent.

**W58.2.26. Scroll chain** *Boolean*

Allow propagating both the horizontal and the vertical scroll to a parent.

**W58.2.27. Scroll on focus** *Boolean*

Automatically scroll object to make it visible when focused.

**W58.2.28. Scroll with arrow** *Boolean*

Allow scrolling the focused object with arrow keys.

**W58.2.29. Snappable** *Boolean*

If scroll snap is enabled on the parent it can snap to this object.

**W58.2.30. Press lock** *Boolean*

Keep the object pressed even if the press slid from the object.

**W58.2.31. Event bubble** *Boolean*

Propagate the events to the parent too.

**W58.2.32. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W58.2.33. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W58.2.34. Ignore layout Boolean**

Make the object positionable by the layouts.

**W58.2.35. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W58.2.36. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W58.2.37. Checked EXPRESSION (boolean)**

Toggled or checked state.

**W58.2.38. Checked state type Enum**

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

**W58.2.39. Disabled EXPRESSION (boolean)**

Disabled state

**W58.2.40. Disabled state type Enum**

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

**W58.2.41. Focused Boolean**

Focused via keypad or encoder or clicked via touchpad/mouse.

**W58.2.42. Pressed Boolean**

Being pressed.

**Events****W58.2.43. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.

- Action - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W58.2.44. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W58.2.45. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W58.2.46. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W58.3. Examples

- Dashboard Widgets Demo

## W59. Terminal

### W59.1. Description

Displays a Terminal window through which the user can enter arbitrary text, as the text is entered, character by character is sent through the `onData` output. It is also possible to enter text into the terminal through flow using the `Data` property.

### W59.2. Properties

#### Specific

##### W59.2.1. Data EXPRESSION (string)

The text that is entered in the Terminal window. It is necessary to add flow input of type `string` or `stream` and enter the name of that input in this property. If the flow input is of the `string` type, then it is necessary to send a string to that input that you want to enter in the terminal – this can be done multiple times, i.e. every time a string is received at that input, it will be entered in the terminal. If the flow input is of `stream` type, then the Terminal Widget listens to see if there is any new data on the stream and when it appears, it writes it to the terminal – for example, in this way it is possible to connect `stdout` or `stderr` output from `ExecuteCommand` Actions on the Terminal Widget.

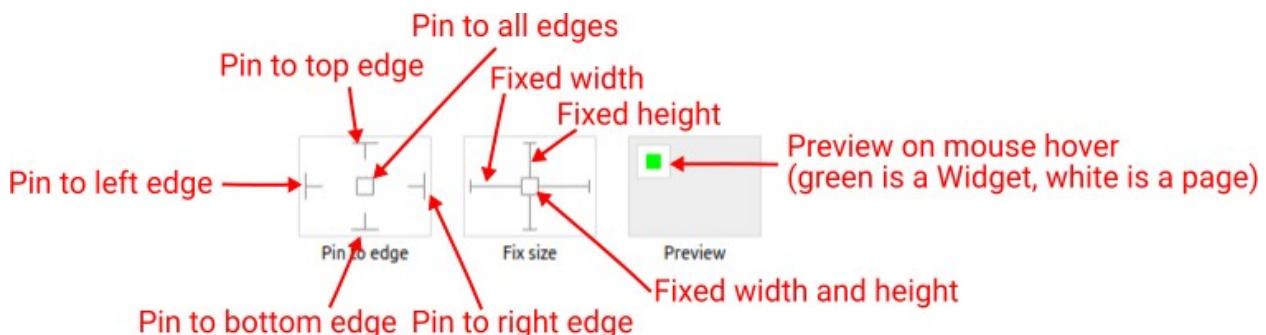

##### W59.2.2. Visible EXPRESSION (boolean)

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W59.2.3. Resizing Any

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

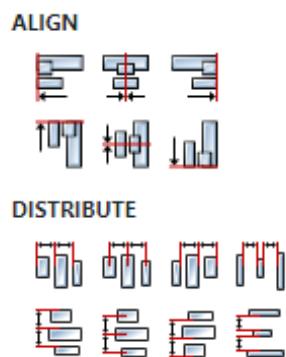

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge*.

and *Fix width*.

#### **W59.2.4. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W59.2.5. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W59.2.6. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### **W59.2.7. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W59.2.8. Width Number**

The width of the component. It is set in pixels.

#### **W59.2.9. Height Number**

The height of the component. It is set in pixels.

#### **W59.2.10. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## Layout

#### **W59.2.11. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## Style

**W59.2.12. Default Object**

Style used when rendering of the Widget.

**Events****W59.2.13. Event handlers Array**

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W59.2.14. Inputs Array**

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

**W59.2.15. Outputs Array**

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

**W59.2.16. Catch error Boolean**

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W59.3. Examples**

- *Dashboard Widgets Demo*

# W60. Textarea

## W60.1. Description

The Text Area is a Widget with a Label and a cursor on it. Texts or characters can be added to it. Long lines are wrapped and when the text becomes long enough the Text area can be scrolled. One line mode and password modes are supported.

More info ([link](#))

## W60.2. Properties

### Specific

#### W60.2.1. Text *EXPRESSION (string)*

Text to be displayed.

#### W60.2.2. Text type *Enum*

Here we can choose that the `Text` item is calculated from the Expression.

#### W60.2.3. Placeholder *String*

A placeholder text can be specified – which is displayed when the `Text` area is empty.

#### W60.2.4. One line mode *Boolean*

If enable, the `Text` area is configured to be on a single line. In this mode the height is set automatically to show only one line, line break characters are ignored, and word wrap is disabled.

#### W60.2.5. Password mode *Boolean*

This enables password mode. By default, if the `\u2022` (Bullet, U+2022) character exists in the font, the entered characters are converted to it after some time or when a new character is entered. If `\u2022` does not exist in the font, `\u2022` will be used.

#### W60.2.6. Accepted characters *String*

We can set a list of accepted characters with this property. Other characters will be ignored.

#### W60.2.7. Max text length *Number*

The maximum number of characters can be limited with this property.

### General

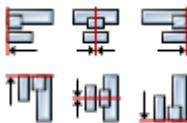

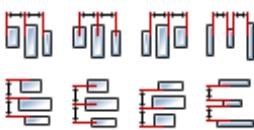

#### W60.2.8. Name *String*

Widget name. We reference the Widget within the project by its name, for example in the LVGL action. For each Widget, we must choose a unique name within the entire project. This field is optional and does not need to be set if we do not need to reference the Widget.

### Position and size

#### W60.2.9. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**ALIGN****DISTRIBUTE****W60.2.10. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W60.2.11. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the Top, Width and Height properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use +, -, \*, and / operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: 18 + 36, 50 + 32 \* 6, (100 - 32) / 2.

**W60.2.12. Left unit Enum**

The following options are available:

- px – Left is default in pixels.
- % – Left is set as a percentage in relation to the parent width.

**W60.2.13. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W60.2.14. Top unit Enum**

The following options are available:

- px – Top is set in pixels.
- % – The top is set as a percentage in relation to the parent height.

**W60.2.15. Width Number**

The width of the component. It is set in pixels.

**W60.2.16. Width unit Enum**

The following options are available:

- px – Width is given in pixels.
- % – Width is given as a percentage in relation to the parent width.
- content – Width is automatically set to fit the entire content in width.

**W60.2.17. Height** *Number*

The height of the component. It is set in pixels.

**W60.2.18. Height unit** *Enum*

The following options are available:

- `px` – Height is given in pixels.
- `%` – Height is given as a percentage in relation to the parent height.
- `content` – Height is automatically set to fit the entire content in height.

**Layout****W60.2.19. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W60.2.20. Use style** *ObjectReference*

Here we can select one of the globally defined Styles so that the Widget uses that Style.

**Flags****W60.2.21. Hidden** *EXPRESSION (boolean)*

Make the object hidden.

**W60.2.22. Hidden flag type** *Enum*

Here we can choose whether the `Hidden` flag state will be calculated from the Expression or not.

**W60.2.23. Clickable** *EXPRESSION (boolean)*

Make the object clickable by input devices.

**W60.2.24. Clickable flag type** *Enum*

Here we can choose whether the `Clickable` flag state will be calculated from the Expression or not.

**W60.2.25. Click focusable** *Boolean*

Add focused state to the object when clicked.

**W60.2.26. Checkable** *Boolean*

Toggle checked state when the object is clicked.

**W60.2.27. Scrollable** *Boolean*

Make the object scrollable.

**W60.2.28. Scroll elastic** *Boolean*

Allow scrolling inside but with slower speed.

**W60.2.29. Scroll momentum Boolean**

Make the object scroll further when "thrown".

**W60.2.30. Scroll one Boolean**

Allow scrolling only one snappable children.

**W60.2.31. Scroll chain hor Boolean**

Allow propagating the horizontal scroll to a parent.

**W60.2.32. Scroll chain ver Boolean**

Allow propagating the vertical scroll to a parent.

**W60.2.33. Scroll chain Boolean**

Allow propagating both the horizontal and the vertical scroll to a parent.

**W60.2.34. Scroll on focus Boolean**

Automatically scroll object to make it visible when focused.

**W60.2.35. Scroll with arrow Boolean**

Allow scrolling the focused object with arrow keys.

**W60.2.36. Snappable Boolean**

If scroll snap is enabled on the parent it can snap to this object.

**W60.2.37. Press lock Boolean**

Keep the object pressed even if the press slid from the object.

**W60.2.38. Event bubble Boolean**

Propagate the events to the parent too.

**W60.2.39. Gesture bubble Boolean**

Propagate the gestures to the parent.

**W60.2.40. Adv hittest Boolean**

Allow performing more accurate hit (click) test. E.g. accounting for rounded corners.

**W60.2.41. Ignore layout Boolean**

Make the object positionable by the layouts.

**W60.2.42. Floating Boolean**

Do not scroll the object when the parent scrolls and ignore layout.

**W60.2.43. Overflow visible Boolean**

Do not clip the children's content to the parent's boundary.

**States****W60.2.44. Checked EXPRESSION (boolean)**

Toggled or checked state.

#### **W60.2.45. Checked state type** *Enum*

Here we can choose whether the `Checked` state will be calculated from the Expression or not.

#### **W60.2.46. Disabled** *EXPRESSION (boolean)*

Disabled state

#### **W60.2.47. Disabled state type** *Enum*

Here we can choose whether the `Disabled` state will be calculated from the Expression or not.

#### **W60.2.48. Focused** *Boolean*

Focused via keypad or encoder or clicked via touchpad/mouse.

#### **W60.2.49. Pressed** *Boolean*

Being pressed.

### Events

#### **W60.2.50. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

### Flow

#### **W60.2.51. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

#### **W60.2.52. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

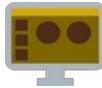

#### **W60.2.53. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

### ***W60.3. Examples***

- *LVGL Widgets Demo*

## W61. Text (Dashboard)

### W61.1. Description

A widget used to display text.

### W61.2. Properties

#### Specific

##### W61.2.1. Text *EXPRESSION (any)*

Text to be displayed. This is an expression and if you only want to display some static text, then that text should be entered in quotation marks. If the expression uses variables, then that expression cannot be calculated in the editor, so the expression will be displayed instead of the text itself.

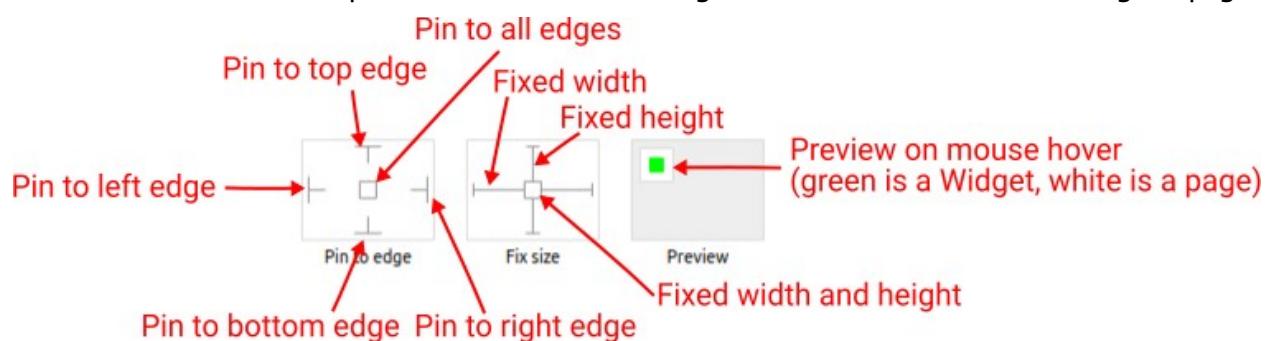

##### W61.2.2. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W61.2.3. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

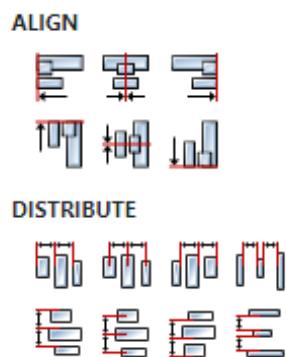

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge*.

and *Fix width*.

#### **W61.2.4. Align and distribute Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W61.2.5. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W61.2.6. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### **W61.2.7. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W61.2.8. Width Number**

The width of the component. It is set in pixels.

#### **W61.2.9. Height Number**

The height of the component. It is set in pixels.

#### **W61.2.10. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## Layout

#### **W61.2.11. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## General

**W61.2.12. Name** *String*

If an expression is used for the `Text` property that cannot be calculated during editing, then the text displayed in the editor can be set here. Also, this text will be displayed in the *Widgets Structure* panel.

**Style****W61.2.13. Default** *Object*

Style that will be used to render the Widget.

**Events****W61.2.14. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W61.2.15. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

**W61.2.16. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

**W61.2.17. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

**W61.3. Examples**

- *Dashboard Widgets Demo*

## W62. Text (EEZ-GUI)

### W62.1. Description

A widget used to display single line text.

### W62.2. Properties

#### Specific

##### W62.2.1. Text *EXPRESSION (any)*

Text to be displayed. This is an expression and if you only want to display some static text, then that text should be entered in quotation marks. If the expression uses variables, then that expression cannot be calculated in the editor, so the expression will be displayed instead of the text itself.

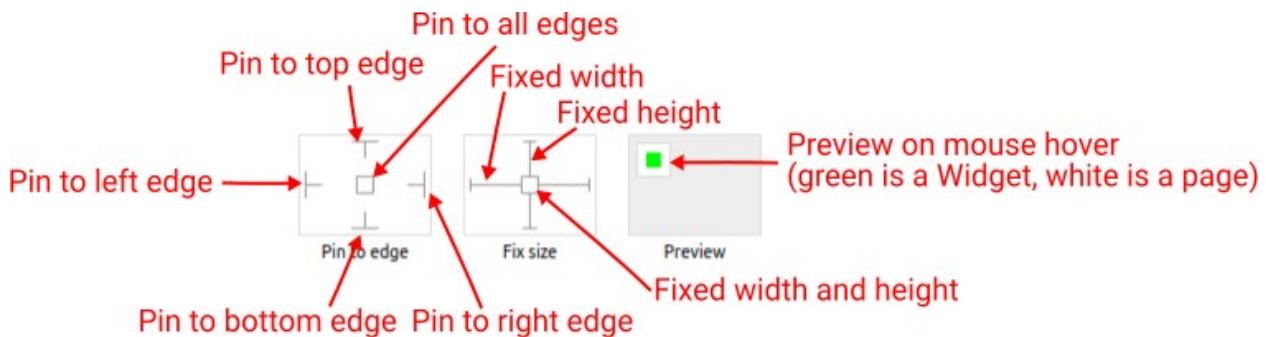

##### W62.2.2. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W62.2.3. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

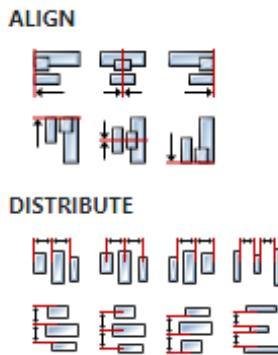

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

##### W62.2.4. Hide "Widget is outside of its parent" warning *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

##### W62.2.5. Align and distribute *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### **W62.2.6. Center widget Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### **W62.2.7. Left Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36, 50 + 32 * 6, (100 - 32) / 2.`

### **W62.2.8. Top Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

### **W62.2.9. Width Number**

The width of the component. It is set in pixels.

### **W62.2.10. Height Number**

The height of the component. It is set in pixels.

### **W62.2.11. Absolute position String**

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### **W62.2.12. Tab title EXPRESSION (string)**

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

## General

### **W62.2.13. Name String**

If an expression is used for the `Text` property that cannot be calculated during editing, then the text displayed in the editor can be set here. Also, this text will be displayed in the *Widgets Structure* panel.

## Style

### W62.2.14. Default Object

Style that will be used to render the Widget.

### W62.2.15. Focused Object

Style to be used for rendering if the Widget is in focus.

## Events

### W62.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W62.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project *Check* to check whether a data line that transmits data of that type is connected to the input or not.

### W62.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the *Loop* component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the *Loop* component will not change the content of the variable in each step, but will send the current value through that output.

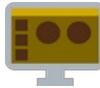

### W62.2.19. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W62.3. Examples

- `eez-gui-widgets-demo`

## W63. TextInput

### W63.1. Description

This Widget is used when we want to enter a text.

### W63.2. Properties

#### Specific

##### W63.2.1. Value *EXPRESSION (any)*

The variable in which the entered text will be stored.

##### W63.2.2. Read only *EXPRESSION (any)*

Set to `true` if you want for this Widget to be read only, i.e. disabled for user input.

##### W63.2.3. Placeholder *EXPRESSION (any)*

The text that is displayed at the beginning when nothing has been entered yet.

##### W63.2.4. Password *Boolean*

If password is entered, then this property should be enabled so that `*` is displayed instead of characters when entering the password.

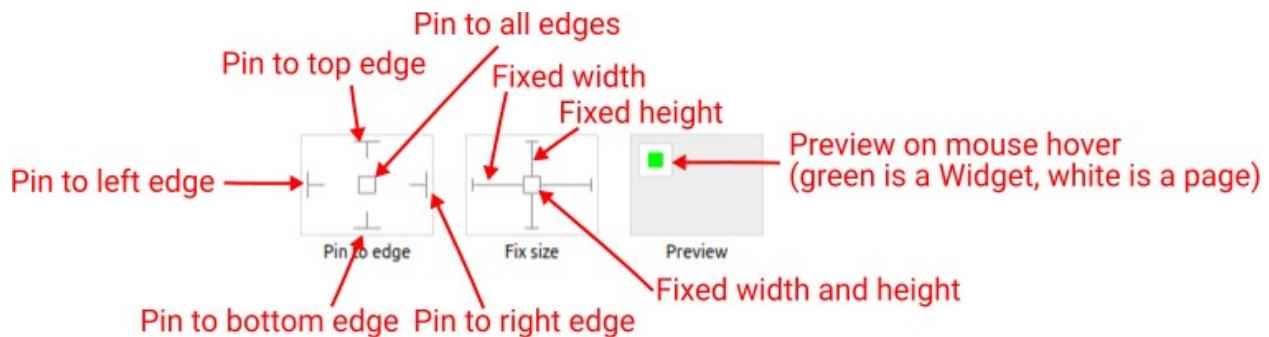

##### W63.2.5. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W63.2.6. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

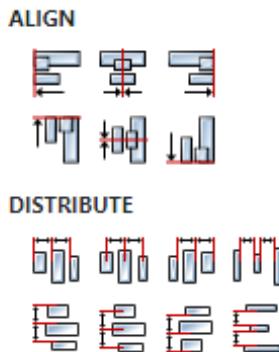

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

### W63.2.7. Align and distribute Any

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

### W63.2.8. Center widget Any

Icons for horizontal and vertical centering of widgets within a page or parent widget.

### W63.2.9. Left Number

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

### W63.2.10. Top Number

Y position of the component in relation to the page or parent widget. It is set in pixels.

### W63.2.11. Width Number

The width of the component. It is set in pixels.

### W63.2.12. Height Number

The height of the component. It is set in pixels.

### W63.2.13. Absolute position String

The absolute position of the component in relation to the page. This property is read-only.

## Layout

### W63.2.14. Tab title EXPRESSION (string)

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### W63.2.15. Default Object

Style used when rendering of the Widget.

## Events

### W63.2.16. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the CLICKED event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- **Event** – Event that is processed, e.g. CLICKED.
- **Handler type** – There are two options: Flow or Action. If Flow is selected, a flow output will be added through which the event is processed, and if Action is selected, then it is necessary to specify which User action will be performed during event processing.
- **Action** - If the Handler type is set to Action, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W63.2.17. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project Check to check whether a data line that transmits data of that type is connected to the input or not.

### W63.2.18. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the Loop component, where we can put the output name for the Variable property instead of e.g. variable name. In that case, the Loop component will not change the content of the variable in each step, but will send the current value through that output.

### W63.2.19. Catch error Boolean

If this checkbox is enabled then an @Error output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W63.3. Examples

- *Dashboard Widgets Demo*

## W64. ToggleButton

### W64.1. Description

A button that can be in two states: `Default` or `Checked`.

### W64.2. Properties

#### Specific

##### W64.2.1. Data *EXPRESSION (boolean)*

If the value of this property is `false` then the button is in the `Default` state, and if the value is `true` then it is in the `Checked` state

##### W64.2.2. Text1 *String*

The text that is displayed when the Widget is in the `Default` state.

##### W64.2.3. Text2 *String*

The text that is displayed when the Widget is in the `Checked` state.

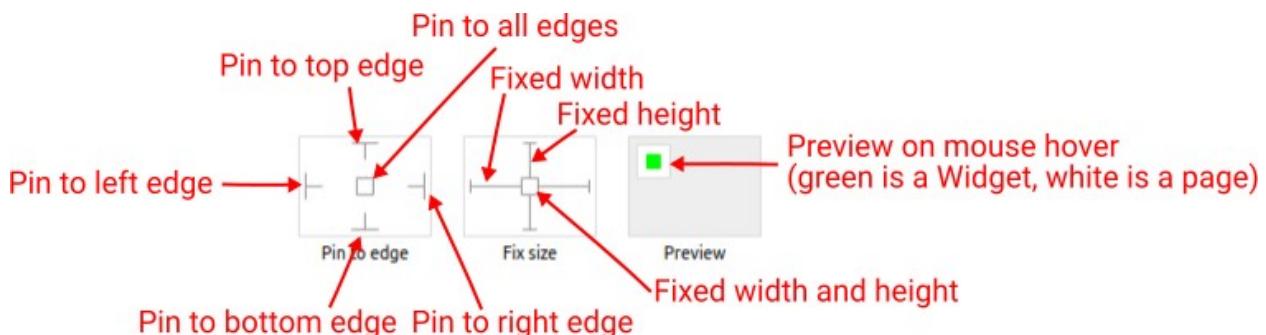

##### W64.2.4. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W64.2.5. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

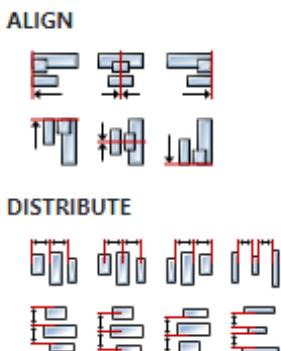

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

**W64.2.6. Hide "Widget is outside of its parent" warning** *Boolean*

Check when we want to hide "Widget is outside of its parent" warning message(s).

**W64.2.7. Align and distribute** *Any*

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

**W64.2.8. Center widget** *Any*

Icons for horizontal and vertical centering of widgets within a page or parent widget.

**W64.2.9. Left** *Number*

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

**W64.2.10. Top** *Number*

Y position of the component in relation to the page or parent widget. It is set in pixels.

**W64.2.11. Width** *Number*

The width of the component. It is set in pixels.

**W64.2.12. Height** *Number*

The height of the component. It is set in pixels.

**W64.2.13. Absolute position** *String*

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W64.2.14. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set

the title of the tab that contains this widget.

## Style

### W64.2.15. Default Object

Style to be used for rendering if the Widget is the `Default` state.

### W64.2.16. Checked Object

Style to be used for rendering if the Widget is the `Checked` state.

## Events

### W64.2.17. Event handlers Array

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

## Flow

### W64.2.18. Inputs Array

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

### W64.2.19. Outputs Array

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

### W64.2.20. Catch error Boolean

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## W64.3. Examples

- `eez-gui-widgets-demo`

## W65. UpDown

### W65.1. Description

This Widget allows us to select a single value using the decrement and increment buttons.

### W65.2. Properties

#### Specific

##### W65.2.1. Data *EXPRESSION (integer)*

The variable in which the selected value in the range of [Min, Max] is saved.

##### W65.2.2. Down button text *String*

The text that is displayed inside the button for the decrement value.

##### W65.2.3. Up button text *String*

The text that is displayed inside the button for the increment value.

##### W65.2.4. Min *EXPRESSION (any)*

The minimum value that can be selected.

##### W65.2.5. Max *EXPRESSION (any)*

The maximum value that can be selected.

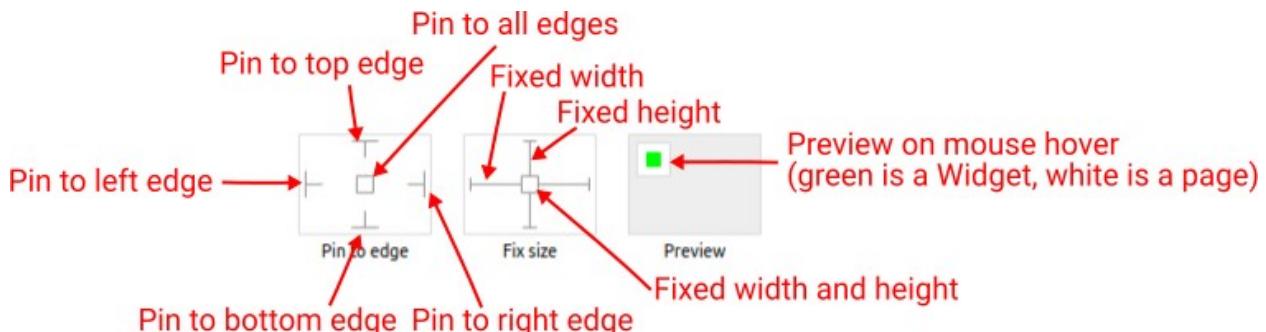

##### W65.2.6. Visible *EXPRESSION (boolean)*

If the calculated expression is true then the Widget is visible, and if it is false then the Widget is hidden. It can be left blank, in which case the Widget is always visible.

#### Position and size

##### W65.2.7. Resizing *Any*

If the page where this Widget is located has the "Scale to fit" option enabled, then this option can be used to control how the position and size of the widget will be calculated when scaling the page:

With the *Pin to edge* option we can fix the top, right, bottom and left edge of the Widget in relation to the page when it changes its original dimension because the *Scale to fit* option is selected. E.g. if we selected *Pin to top edge* then the distance between the top edge of the page and the top edge of the Widget will always be the same, in other words the Top position does not change the value. If *Pin to top edge* is not selected, then the Top position will scale proportionally as the page height scales.

Using the *Fix size* option, we can fix the width/height of the Widget, i.e. if this option is selected the

width/height will always be the same, and if not selected the width/height will scale proportionally as the page height scales.

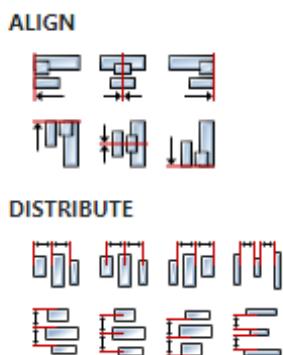

Note: If *Pin to left edge* and *Pin to right edge* are selected, then the *Fix width* option will be disabled, and conversely if *Fix width* is selected, then both *Pin to left edge* and *Pin to right edge* cannot be selected, because both cannot be satisfied. The same applies to *Pin to top edge* and *Pin to bottom edge* and *Fix width*.

#### **W65.2.8. Hide "Widget is outside of its parent" warning   Boolean**

Check when we want to hide "Widget is outside of its parent" warning message(s).

#### **W65.2.9. Align and distribute   Any**

Alignment icons and component distribution. Alignment icons appear when two or more components are selected, and distribution icons appear when three or more components are selected.

#### **W65.2.10. Center widget   Any**

Icons for horizontal and vertical centering of widgets within a page or parent widget.

#### **W65.2.11. Left   Number**

X position of the component in relation to the page or parent widget. It is set in pixels.

Hint: when setting the value of this property (as well as the `Top`, `Width` and `Height` properties), simple mathematical expressions can be used. When we enter an expression and press enter, the expression will be evaluated and the result set as the value of this property. It is allowed to use `+`, `-`, `*` and `/` operators in expressions. Brackets can also be used.

Examples of such mathematical expressions: `18 + 36`, `50 + 32 * 6`, `(100 - 32) / 2`.

#### **W65.2.12. Top   Number**

Y position of the component in relation to the page or parent widget. It is set in pixels.

#### **W65.2.13. Width   Number**

The width of the component. It is set in pixels.

#### **W65.2.14. Height   Number**

The height of the component. It is set in pixels.

#### **W65.2.15. Absolute position   String**

The absolute position of the component in relation to the page. This property is read-only.

**Layout****W65.2.16. Tab title** *EXPRESSION (string)*

If this widget is a child of a container with layout set to `Docking Manager`, use this property to set the title of the tab that contains this widget.

**Style****W65.2.17. Default** *Object*

Style used when rendering the background of the Widget and text.

**W65.2.18. Buttons** *Object*

Style used to render the button.

**Events****W65.2.19. Event handlers** *Array*

List of event handler definitions. During execution, the widget can generate certain events (e.g. the `CLICKED` event is generated when the touchscreen is pressed and released within the Widget) and through this list we can specify the method of event processing. We must define these properties for each event handler:

- `Event` – Event that is processed, e.g. `CLICKED`.
- `Handler type` – There are two options: `Flow` or `Action`. If `Flow` is selected, a flow output will be added through which the event is processed, and if `Action` is selected, then it is necessary to specify which User action will be performed during event processing.
- `Action` - If the `Handler type` is set to `Action`, then here we need to enter the name of the User action that will be performed during the processing of the selected event.

**Flow****W65.2.20. Inputs** *Array*

Additional component inputs that the user can add as desired in order to use them to receive additional data needed when evaluating expressions in properties. Each input is given a name and type. Name is used when referencing an input within an expression. A type is used to project `Check` to check whether a data line that transmits data of that type is connected to the input or not.

**W65.2.21. Outputs** *Array*

Additional component outputs that the user can add to send data through. Each output is assigned a name and type. An example of using this output is e.g. in the `Loop` component, where we can put the output name for the `Variable` property instead of e.g. variable name. In that case, the `Loop` component will not change the content of the variable in each step, but will send the current value through that output.

**W65.2.22. Catch error** *Boolean*

If this checkbox is enabled then an `@Error` output will be added to the component and if an error occurs in this component during the execution of the Flow, the Flow will continue through that output. The data that will be passed through that output is the textual description of the error.

## I1. Home page instrument sections

The top of the *Instruments* tab page (Fig. 1) contains a Search bar (1) for filtering by the name of the instruments whose thumbnails will be displayed (3). At the top of the page (2) there are also general options related to Instruments.

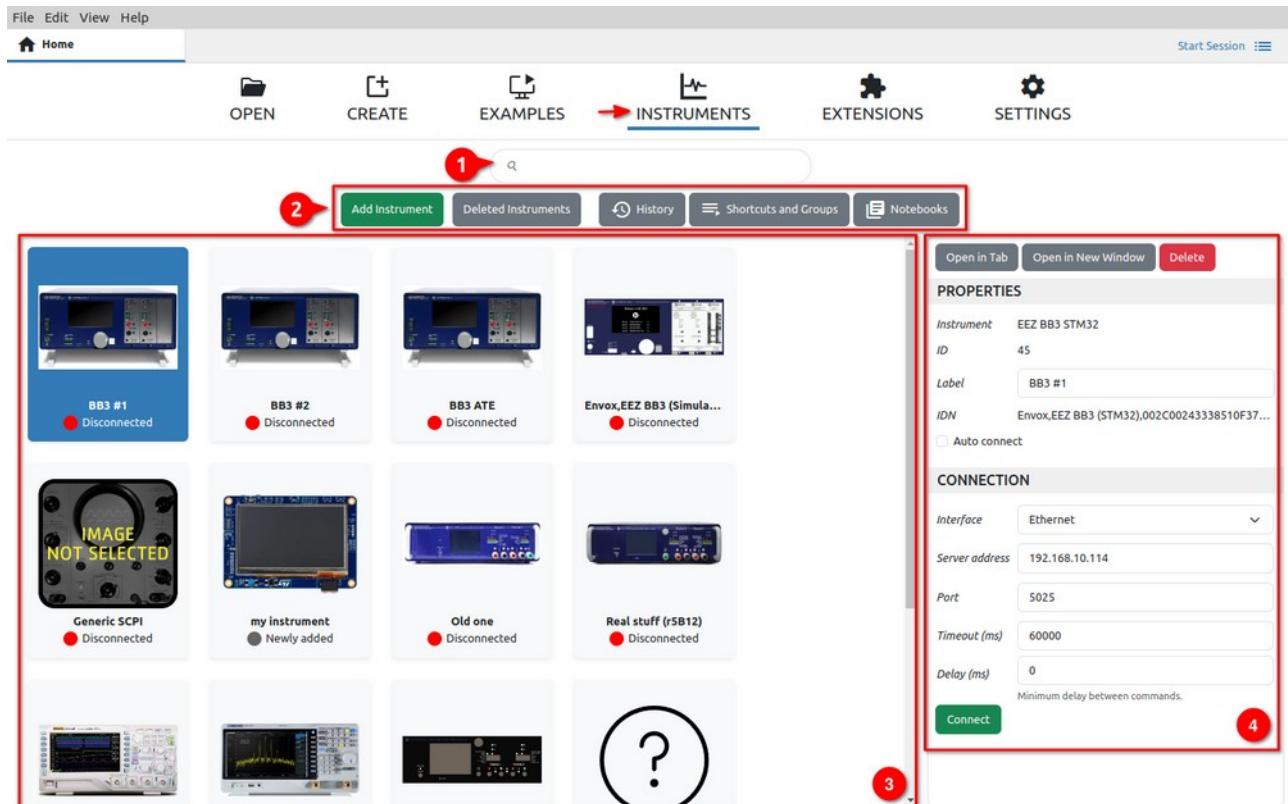

Fig. 1: Home page instrument options

### I1.1. History

History displays communication via the *Terminal* option for all instruments in one place. In this way, it will be easier to search all activities as well as to add notes, files and graphs in the same way as in the *Terminal* of the currently selected instrument, as will be described below.

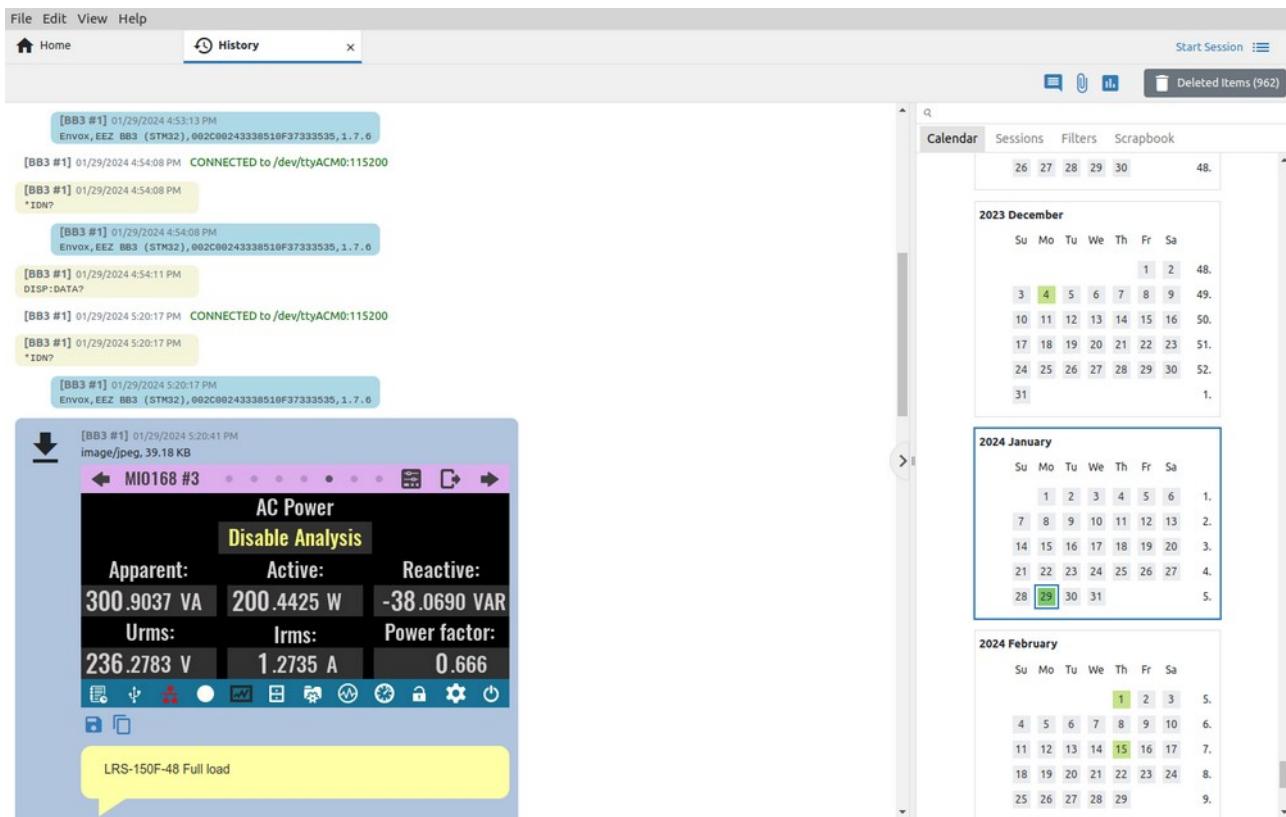

Fig. 2: Instruments History view

## 11.2. Shortcuts and Groups

Just like with *History*, *Shortcuts and Groups* is not a system feature, but only displays the available shortcuts and their groups in one place for easier searching, editing, deleting and adding new shortcuts and their groups.

Therefore, all operations with shortcuts on this page are possible as via the *Shortcuts* page of the currently selected instrument, which will be described below.

## 11. Home page instrument sections

Fig. 3: Instruments Shortcuts and Groups view

### 11.3. Notebooks

The *Notebooks* feature enables data collected from one or more sources (instruments) to be stored and presented in one place. Data stored in this way can be searched as if they belonged to a single source. Notebooks can also be appended, exported and imported, which facilitates the exchange of collected data.

The screenshot shows the Rigol software interface with the 'Notebooks' tab selected. The top navigation bar includes 'File', 'Edit', 'View', 'Help', and tabs for 'Home', 'Rigol', 'BB3', and 'Notebooks'. The 'Notebooks' tab has a blue background. Below the tabs is a toolbar with seven icons numbered 1 through 7. The main area displays a list of notebooks with preview snippets. The first snippet (1) shows a timestamp and source information. The second snippet (2) shows a timestamp, source, and command history. The third snippet (3) shows a timestamp, source, and command history. The fourth icon (4) is highlighted with a red circle and points to a waveform plot in the central workspace. The fifth icon (5) is highlighted with a red circle and points to a calendar view. The sixth icon (6) is highlighted with a red circle and points to a filters view. The seventh icon (7) is highlighted with a red circle and points to a scrapbook view.

Fig. 4: Instrument Notebooks view

## # Option

## 1 Add / Import notebook

## Description

Create a new blank notebook or import a notebook file. When creating a new notebook, you will need to enter a name. To import data into a notebook, use the Notebook option in the instrument's *Terminal*, as shown in Fig. 6: (1) go to the *Terminal* tab in the *Action bar*, (2) select one or more items and (3) export them to a notebook file, a new notebook or an already created notebook.

In the case of exporting to a file, it will be necessary to choose a destination on the local storage, and in the case of exporting to a new notebook, the name of the notebook should be entered.

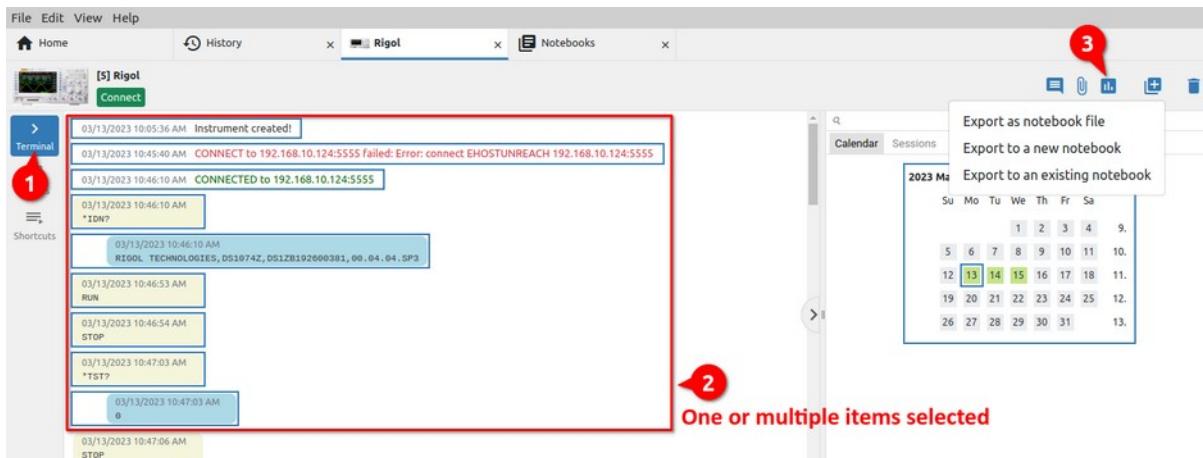

Fig. 5: Adding items to the notebook

## 2 Remove notebook

Remove the notebook from the list.

## 3 Change notebook name

Change notebook name.

## 4 Show deleted notebooks

Notebooks that have been removed from the list are not immediately deleted from the database. This option enables the display of all notebooks (Fig. 6) that have been removed from the list and offers the possibility to restore (return to the list) or permanently delete the notebook.

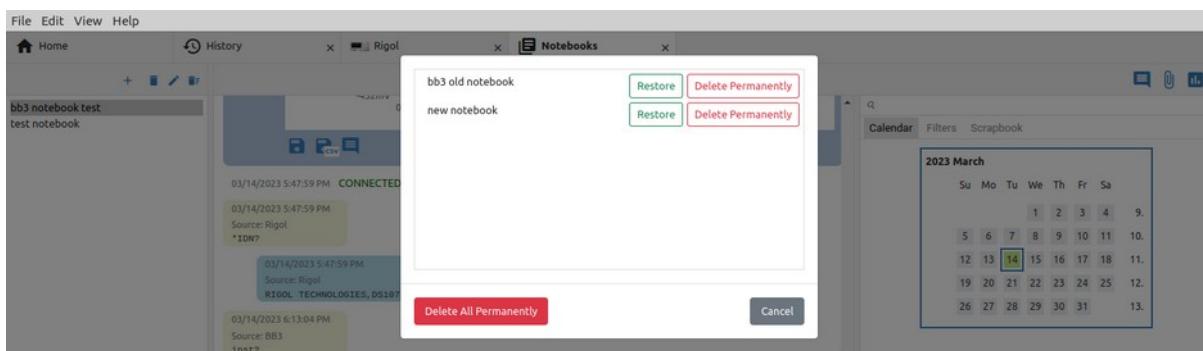

Fig. 6: Deleted notebooks

## 5 Add note

Adding a note to the notebook (Fig. 7). The number of notes is not limited and the last added note will appear at the bottom of the notebook (Fig. 8).

## 11. Home page instrument sections

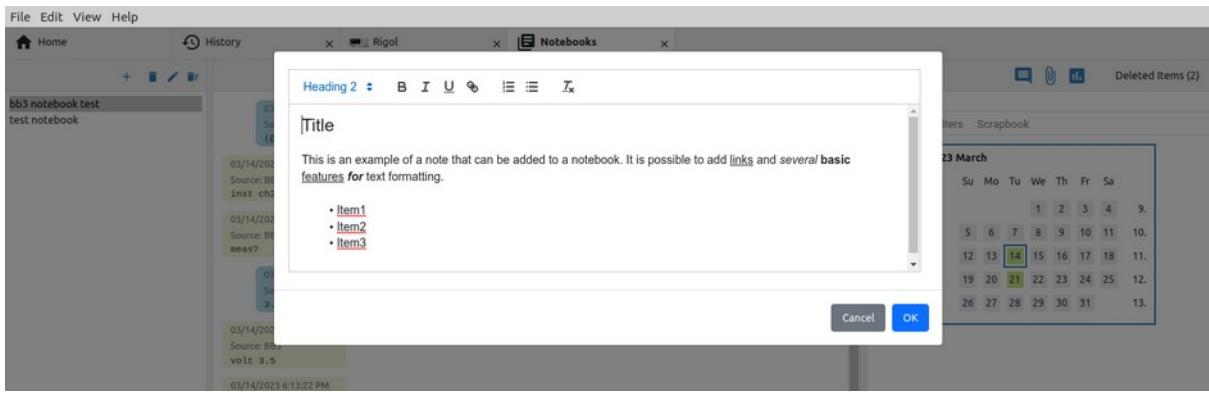

Fig. 7: Adding a new note to the notebook

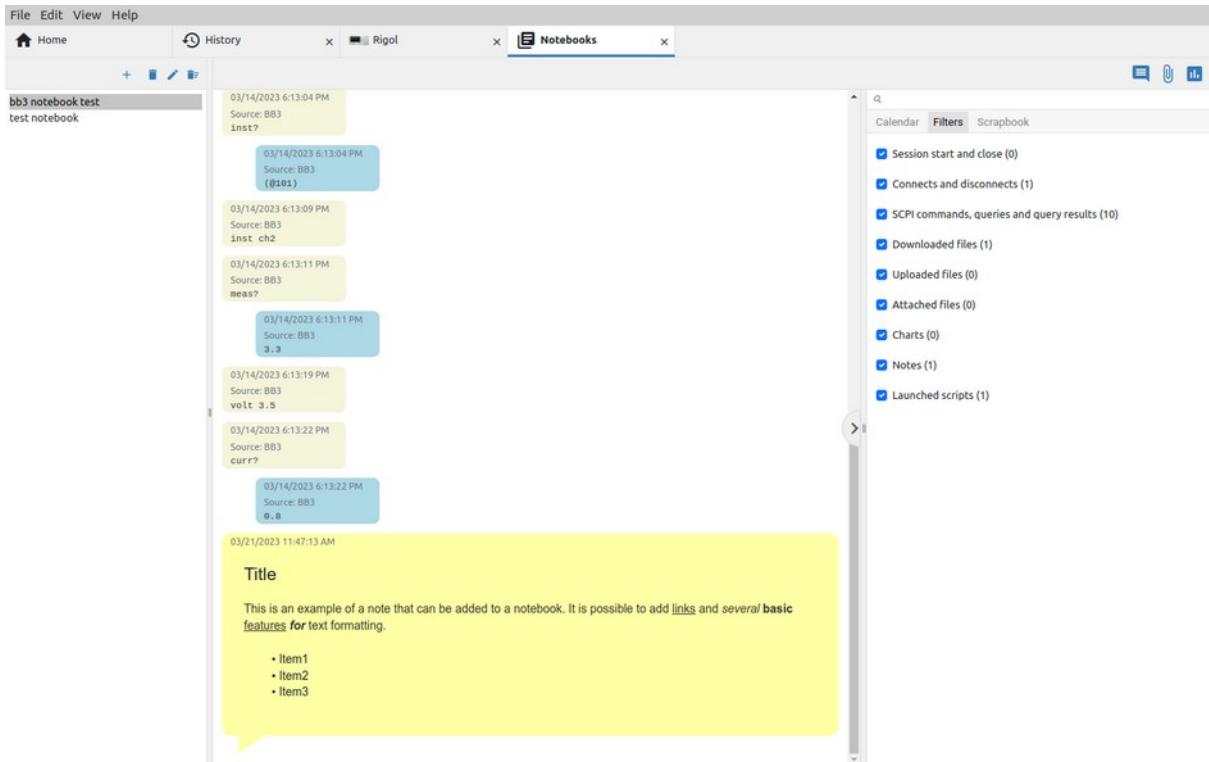

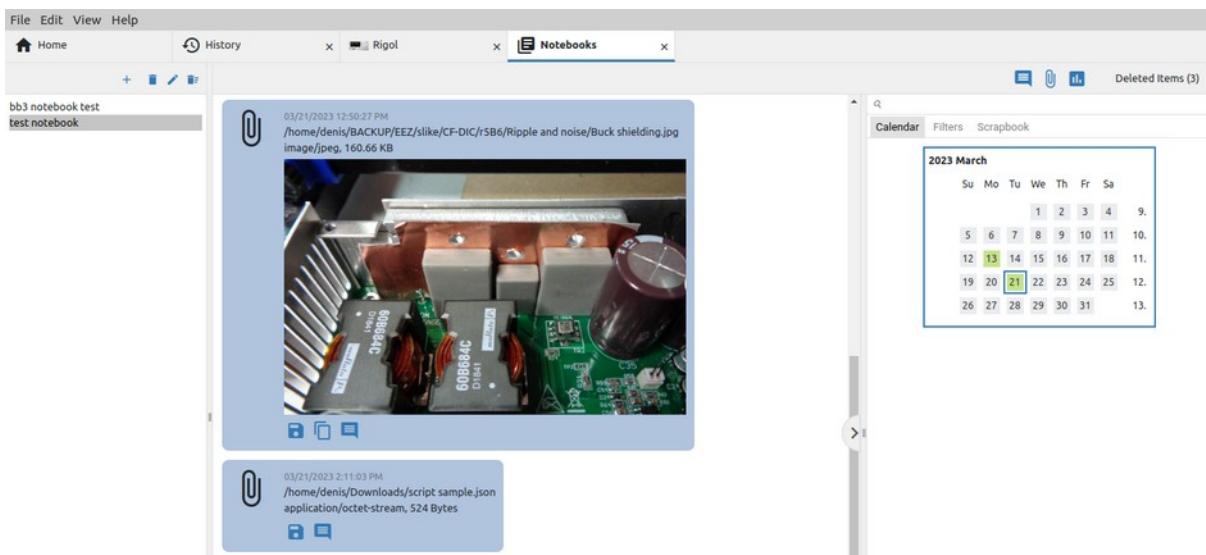

Fig. 8: Newly added note in the notebook

## 6 Attach file

Different files from local storage can be added to the notebook. In this way, all relevant data collected with the instruments can be combined together with images, recordings, datasheets into a whole that can be searched and further shared.

All imported files are marked with a paper clip icon in the upper left corner. It also displays the full path from where the file was imported as well as its size (Fig. 9).

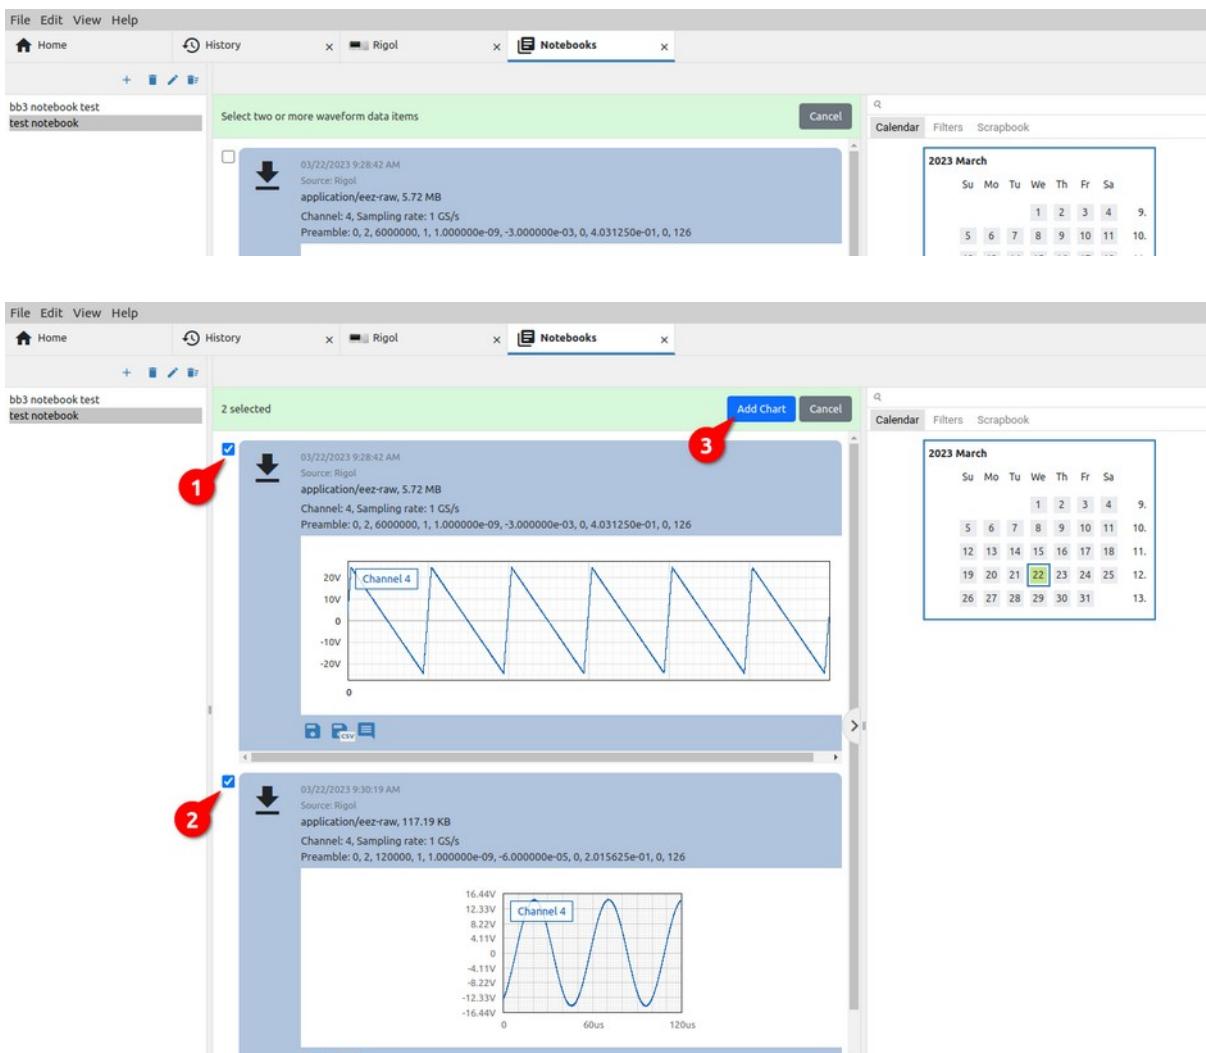

Files whose format EEZ Studio can recognize (.jpeg, .png, etc.) also have a preview. Such files, in addition to the option to save to local storage and to add a note, will also have the option to copy to the clipboard.

*Fig. 9: Files imported into the notebook*

## 7 Add chart

This option allows you to create a new graph from two or more existing ones and add it to the notebook. To create a new graph, you will need to select at least two of the found graphs in the currently selected notebook (1, 2) and add it to the notebook (3) as shown in Fig. 10.

*Fig. 10: A selection of graphs to add to the notebook*

## 11. Home page instrument sections

A successfully created graph will appear at the end of the notebook and will have a graph icon in the upper left corner (Fig. 11).

Fig. 11: Newly created graph added to notebook

### 11.4. Items purge and restore

Items that are removed from the list are not immediately deleted from the database, which leaves the possibility to restore them if needed. The counter of deleted items that can be restored appears in the right corner as shown in Fig. 12.

The counter can be seen in *Notebooks* but also in the *Terminal* tab of the currently selected instrument, and the same rules apply to restore or purge items in both places.

Fig. 12: Deleted items counter

When there are items to delete, they can be accessed by clicking on the counter, when the option to purge all items will first appear (Fig. 13).

Fig. 13: Empty trash option (no selected items)

If one or more items are selected from the list of deleted items, options for restore (2) or purge (3) will appear (Fig. 14).

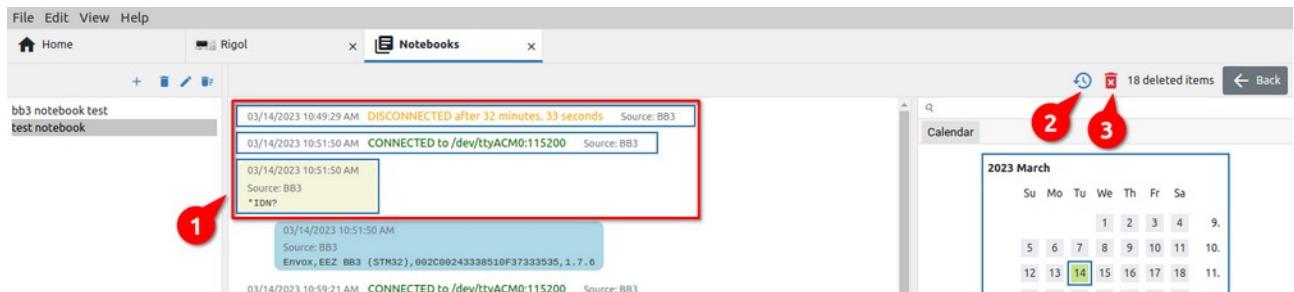

Fig. 14: Selection of deleted items for restore or purge

## I1.5. Instrument Extension (IEXT) Manager

The EEZ Studio use *Instrument Extensions* (IEXTs) to make communication and control of various instruments easier and more efficient. EEZ Studio comes with IEXTs for several instruments including EEZ H24005, EEZ BB3 as well as Generic SCPI which can be used for basic operations such as connection testing and sending commands and queries. (e.g. \*IDN?).

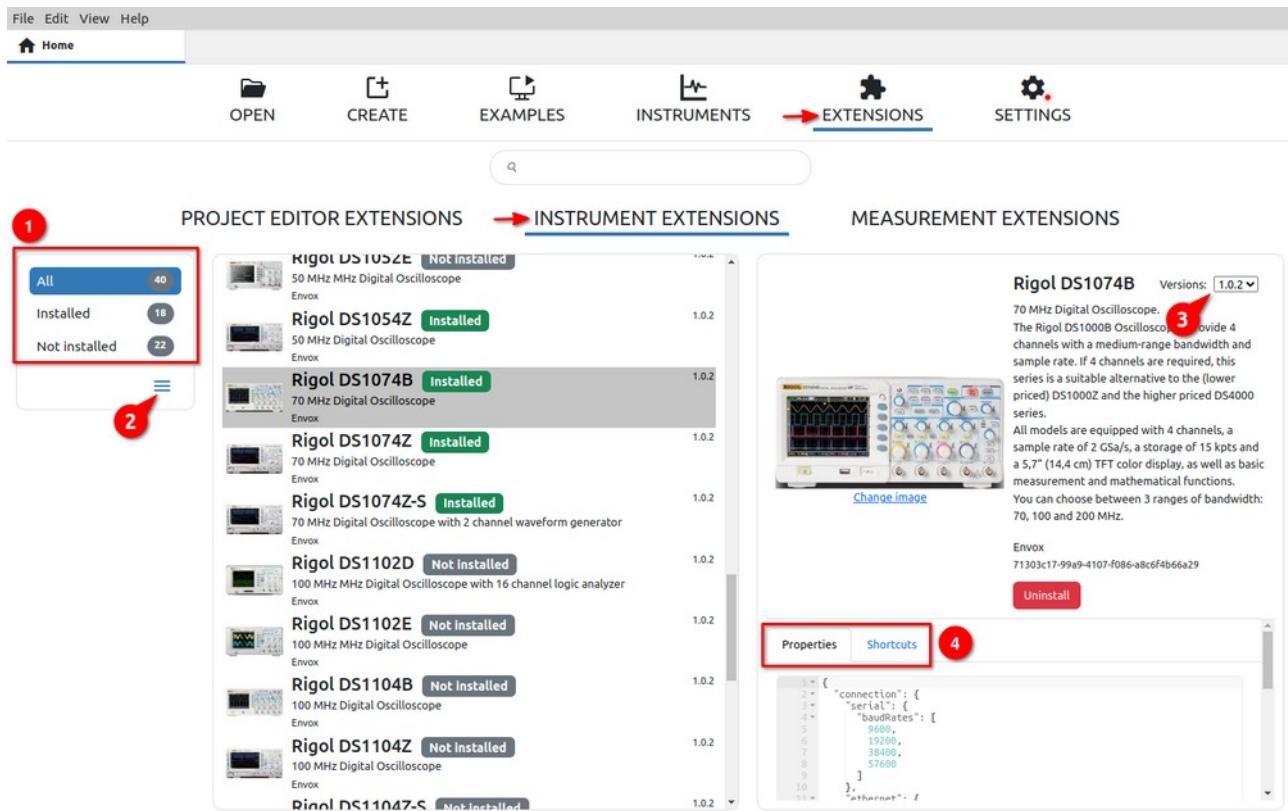

Fig. 15: Instrument extension (IEXT) Manager view

#	Option	Description
1	<i>View</i>	Filters for displaying IEXT in the list: it is possible to display all, only installed or only those that are not installed. The number of filtered IEXTs is displayed next to each option.
2	<i>Update / Install actions</i>	All approved IEXTs are in the catalog on GitHub, with which EEZ Studio synchronizes its catalog every time it is started. Synchronization with the IEXT catalog can also be started manually at any time using the <i>Upgrade Catalog</i> option. The <i>Install extension</i> option allows installing an IEXT that is not in the catalog (from local storage).
3	<i>Versions</i>	IEXT can have multiple versions. If there is more than one, it is possible to change the installed IEXT with one of the versions from the list. In this case, the Replace option will appear as in Fig. 16.

Fig. 16: Changing installed IEXT version

## 4 Properties

IEXT for a supported instrument can have several properties that will be displayed below the IEXT description. All displayed properties are for informational purposes and cannot be changed here.

### 11.6. Add instrument

By using *Add instrument* (Fig. 1), only those instruments for which there is an IEXT in the IEXT catalog can be added to the workbench.

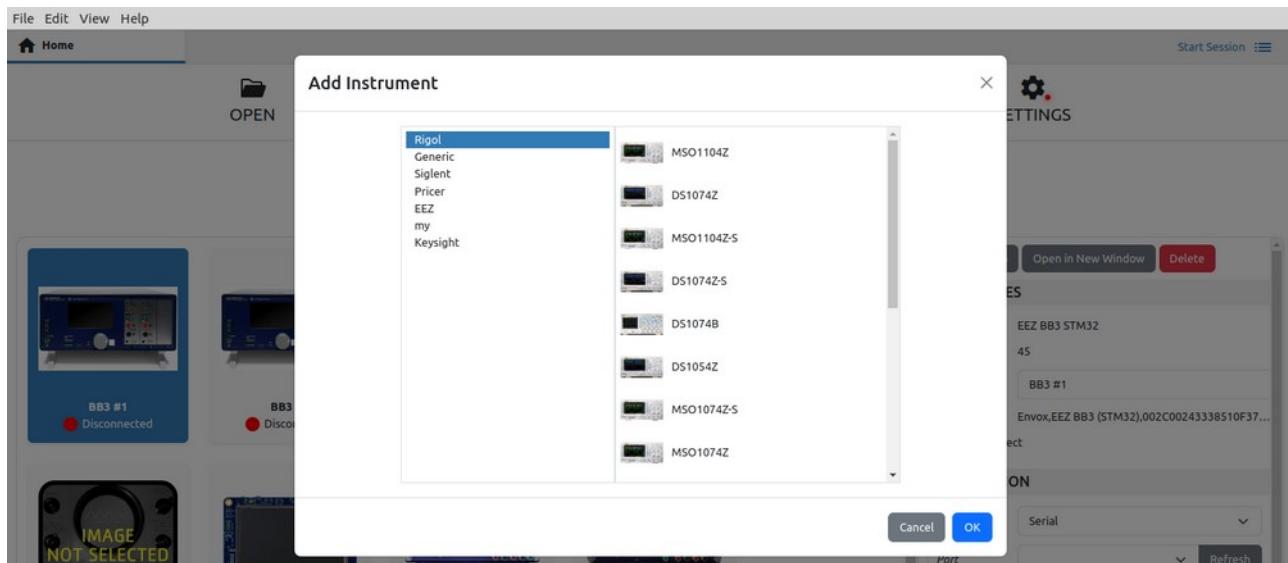

Fig. 17: Add instrument to workbench

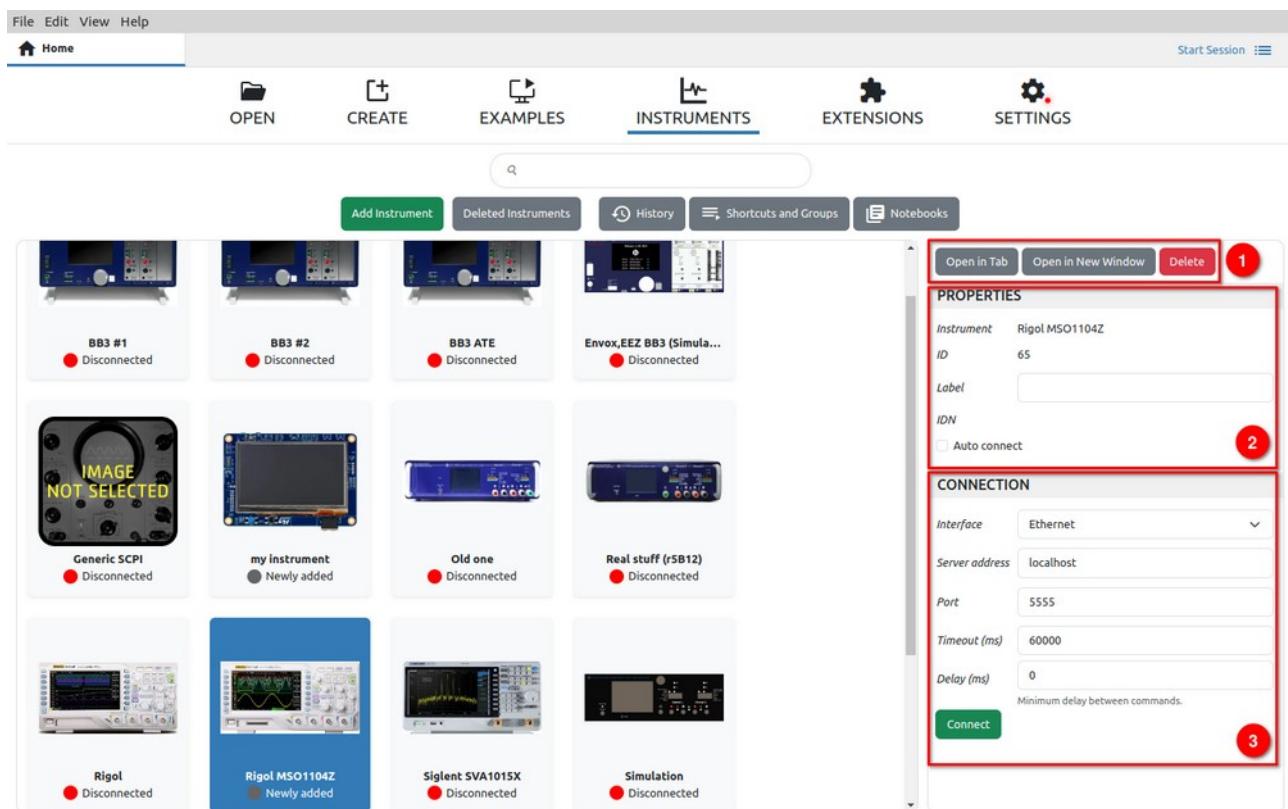

Fig. 18: New added instrument

A successfully added instrument will appear on the workbench (Fig. 18) with the label *Newly added*, and when selected, the sidebar will have the following sections:

#	Option	Description
1	<i>Actions</i>	Basic set of actions for displaying the instrument in a separate tab or new window and for removing it from the workbench.
2	<i>Properties</i>	The properties of the instrument contain information about the IEXT name, the internal ID, the instrument label that can be changed as desired, the identification string that the instrument returns in response to the SCPI query *IDN? and the option to automatically establish a connection with the instrument when starting EEZ studio.
3	<i>Connection</i>	Connection type. Connections to the instrument are defined in IEXT and there can be several of them. Depending on the type of connection (e.g. Serial, Ethernet, USBTMC, VISA), the associated connection parameters will also be displayed.

*Please note that the USBTMC and VISA interfaces are experimental and may not work properly on your computer.*

For normal communication via the VISA interface, it will be necessary to install a free [R&S®VISA](#) driver. In case it is not installed or there is some problem in communication with it, an error message will appear as in Fig. 19.

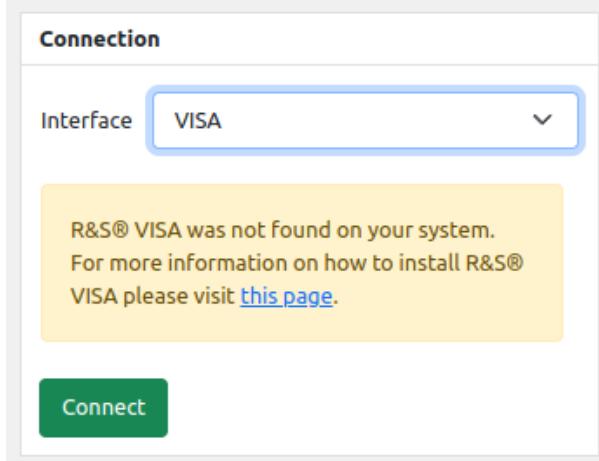

Fig. 19: VISA driver error message

## I1.7. Establishing a connection with the instrument

Connection to the instrument added to the workbench will be possible as shown in Fig. 20: select the instrument from the workbench (1), select the interface in the *Connection* section (2) and click the *Connect* button (3).

If the Instrument tab (1) is open, as shown in Fig. 21 to establish a connection, it will be necessary to click on the *Connect* button (2) when a dialogue for choosing an interface will open in which the connection parameters are defined.

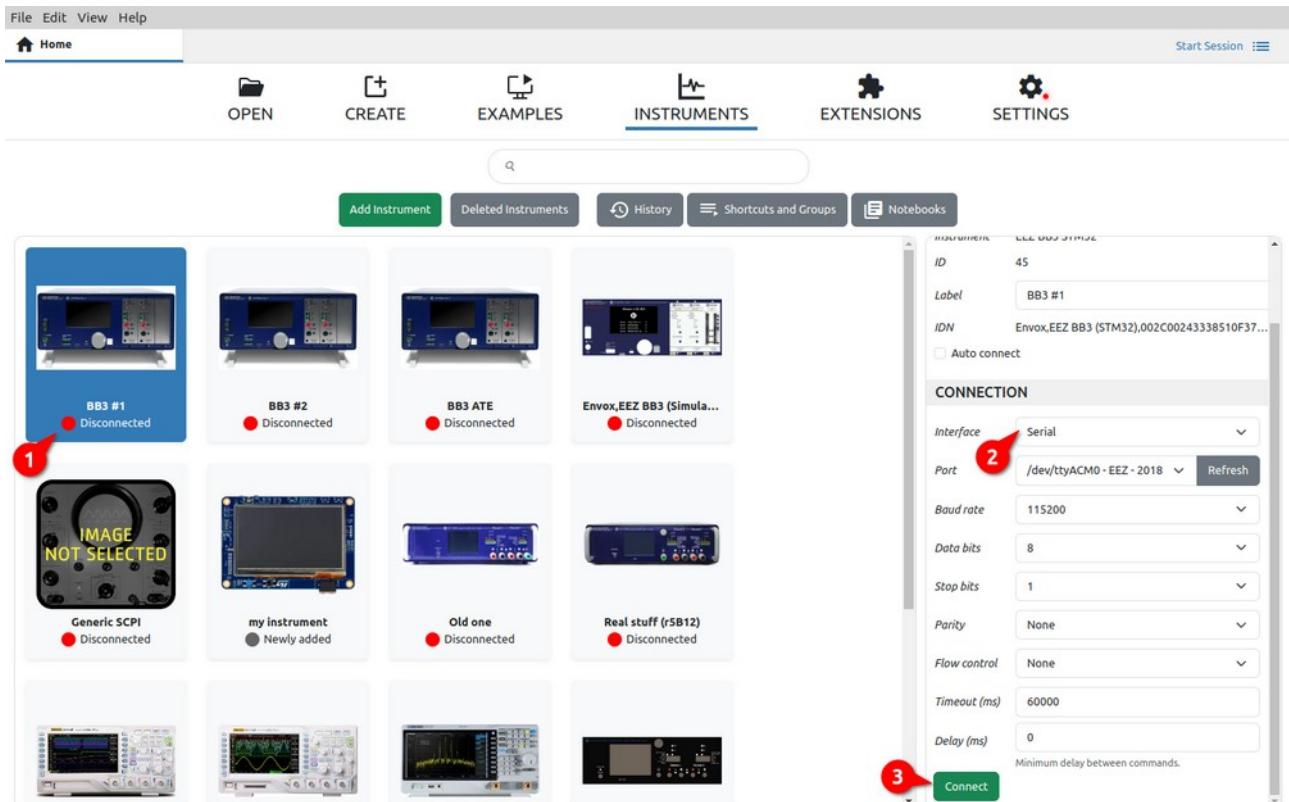

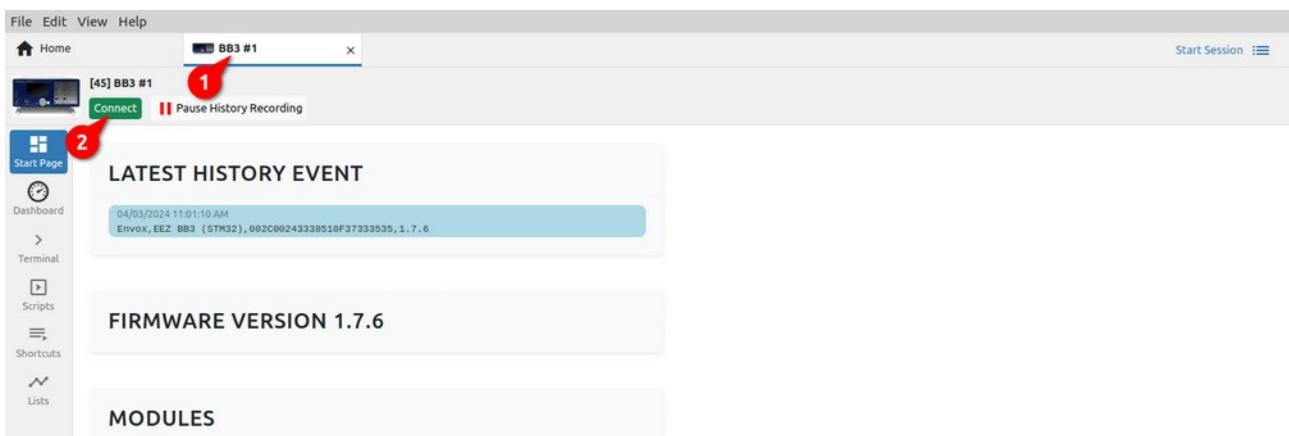

Fig. 20: Selecting an instrument on the workbench to establish a connection

## EEZ Studio Reference Guide

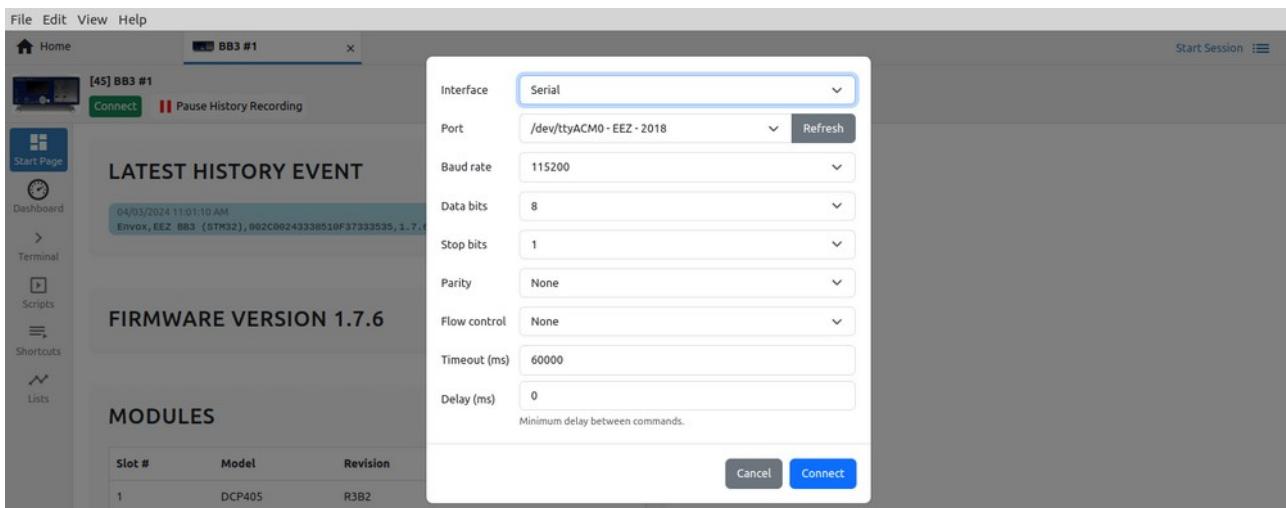

Fig. 21: Establishing a Connection from the Instrument tab

Once the connection is established, it will be possible to close the connection by selecting the Disconnect button (Fig. 22).

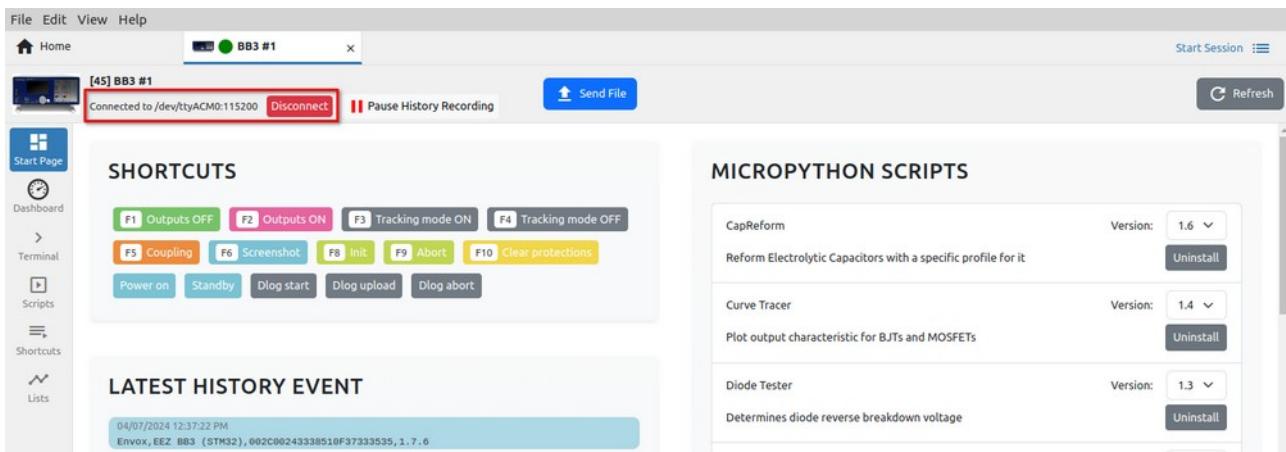

Fig. 22: Option to close the connection

## 12. Instrument activity bar

When we open the instrument in its view, an *Activity bar* will be displayed along the left edge. The number of options in the activity bar is defined by IEXT and may vary for different instruments.

### 12.1. Start page (EEZ BB3 only)

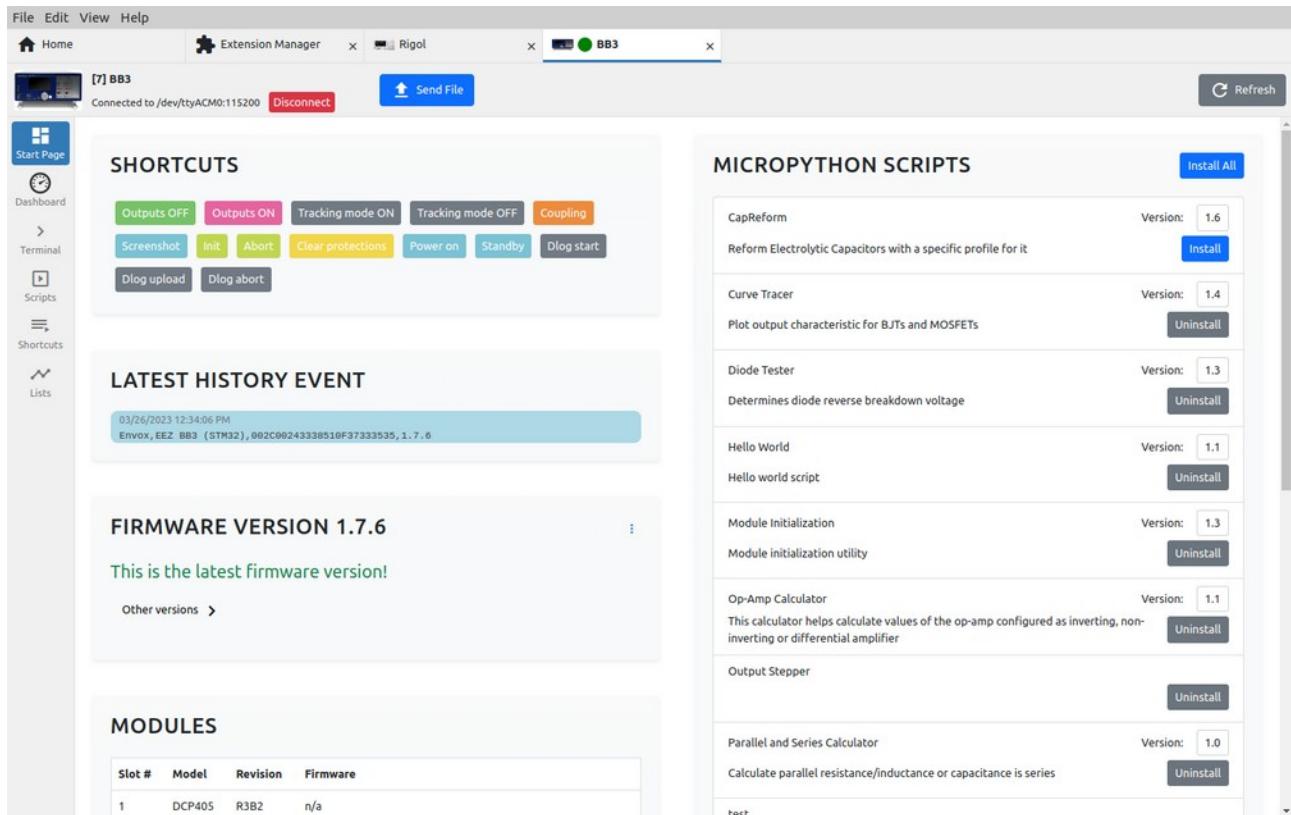

Fig. 23: EEZ BB3 start page

#### Section / option

*Send file*

#### Description

Opens a dialog for sending the file to EEZ BB3. To send, it is necessary to choose the source file, the desired name of the destination file. The destination folder path can be chosen from the offered list or set a new one. The parameters of the send file protocol are predefined and can be viewed and changed via the "gear" button in the lower left corner.

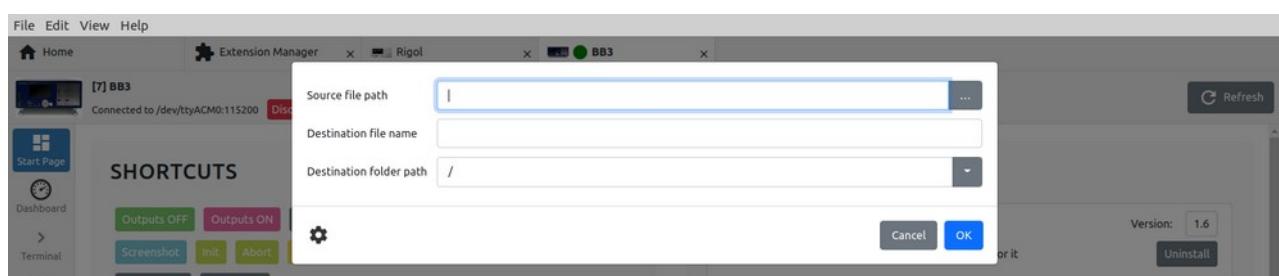

Fig. 24: Sending a file to EEZ BB3

*Refresh*

Refresh all data displayed on the *Start page*.

*Shortcuts*

List of available shortcuts from which they can be executed directly.

*Latest history event*

Shows the last result of interaction with the instrument via the *Terminal* tab.

*Firmware version*

Displays information about the installed firmware version. If a newer version than the currently installed one is published, an up-

grade option will be offered. It is also possible to manually install another version of the firmware (1) or downgrade the version from the offered list (2) as shown in Fig. 25.

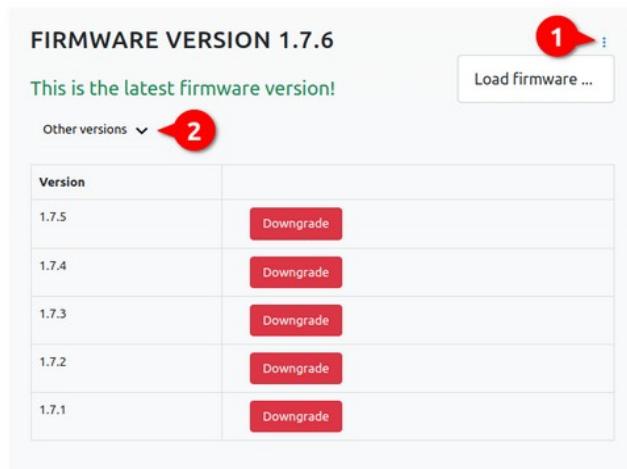

Fig. 25: EEZ BB3 firmware version section

#### Modules

Display of installed modules. If the module has firmware, information will be displayed as to whether it is up-to-date or not and the possibility to upgrade or install another version.

*Upload Pinout Pages* is used to update pinout images of all modules.

Slot #	Model	Revision	Firmware
1	DCP405	R3B2	n/a
2	DCP405	R3B2	n/a
3	MIO168	R2B4	0.12      This is the latest firmware version!

Fig. 26: EEZ BB3 modules section

#### Micropython scripts

List of all Micropython scripts that are on EEZ BB3. For scripts that are synchronized with the GitHub repository, their versions and options to install or uninstall will be displayed.

For scripts created by the user, versions will not be displayed, only the option to install or uninstall.

#### Lists

Program lists created by the user (see Section I2.4), and which are located on EEZ BB3. Lists can be downloaded, uploaded and edited.

		Download All	Upload All
3.3V stress test	03/14/2023 10:51:38 AM	Download	Upload
List1	03/15/2023 5:08:38 PM	Upload	Edit
New list	03/15/2023 2:33:07 PM	Upload	Edit
Another sample			

Fig. 27: EEZ BB3 program lists

## 12.2. Dashboard

Fig. 28 shows an example Dashboard that enables simple operations with EEZ BB3 modules.

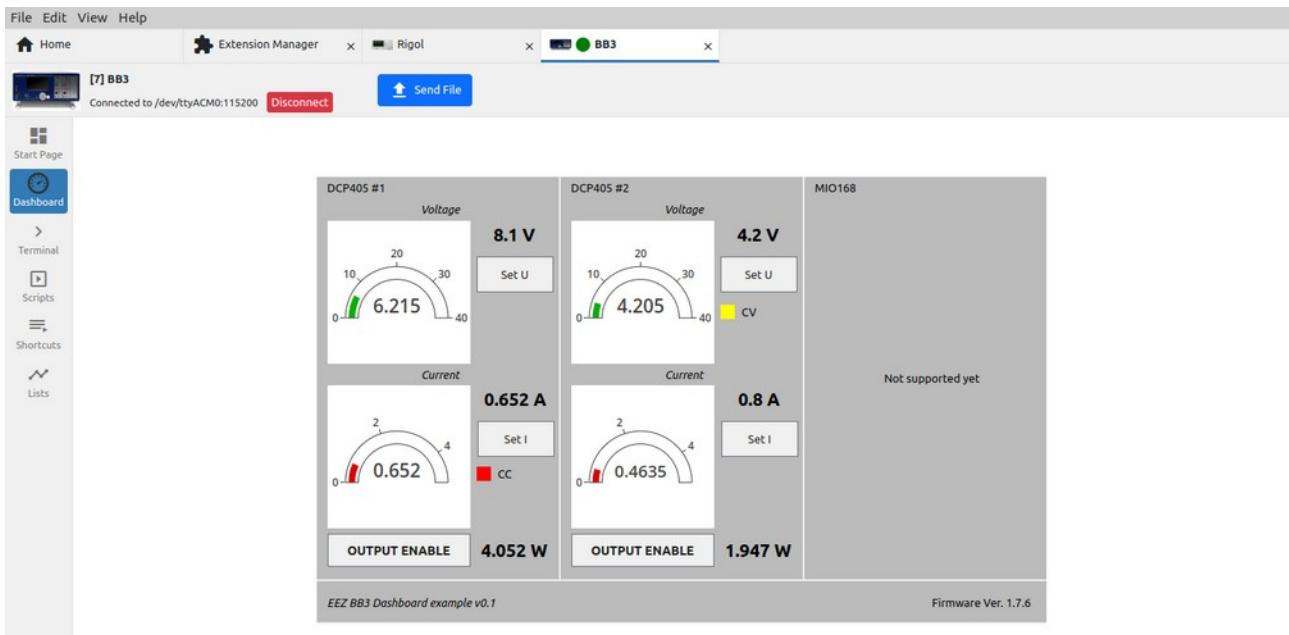

Fig. 28: Instrument dashboard example

## 12.3. Terminal

The *terminal* allows interaction with the instrument, which is primarily based on the SCPI specification.

The number of SCPI commands varies greatly between instruments, and IEXT can also include help for easier finding of the desired SCPI command or query that will be displayed at the bottom of the screen (7).

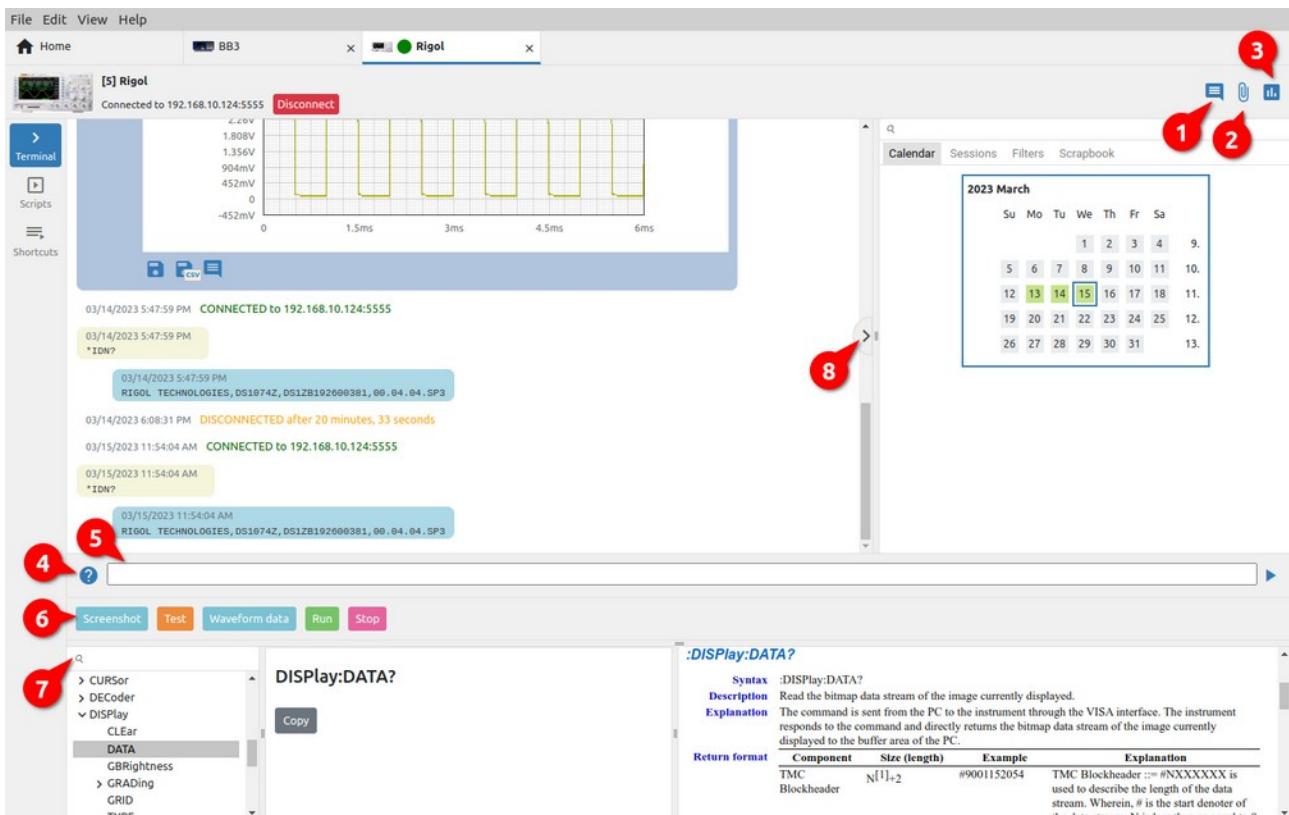

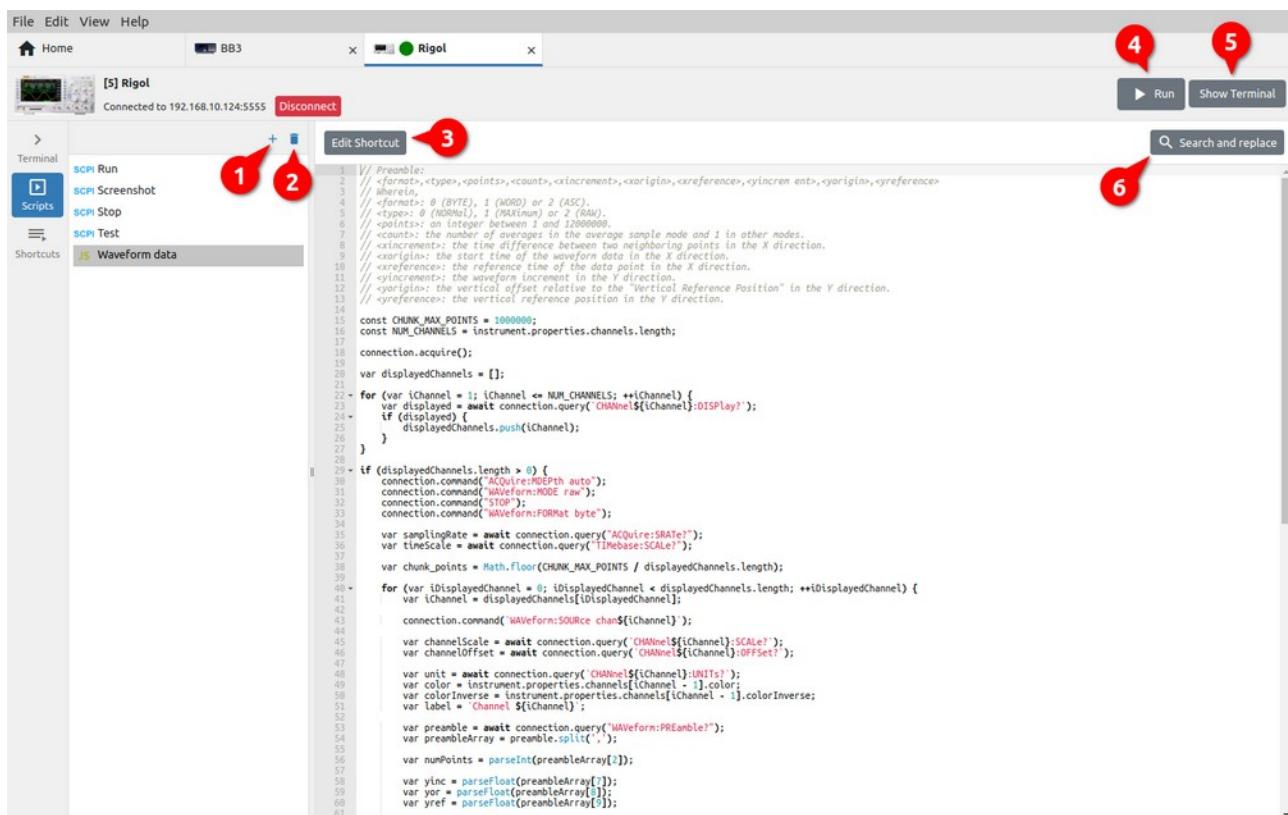

Fig. 29: Instrument terminal

#	Option	Description
1	Add note	Adds a note (see Section 6.3).
2	Attach file	Attaching a file (see Section 6.3).
3	Add chart	Creating a new chart from two or more charts (see Section 6.3).
4	Show/hide commands catalog	Show or hide the help section for instrument commands at the bottom of the <i>Terminal</i> view. Command help will only be displayed if it is defined in IEXT for the selected instrument. Help for each command contains an explanation and syntax of how the command is used with the option to copy it to the command line (5).
5	Command line	Prompt line for sending a command to the instrument.
6	Shortcuts bar	IEXT imported and user defined shortcuts.
7	Command search	Commands help search.
8	Show/hide Side bar	Show or hide sidebar with history search options.

## 12.4. Scripts

Scripts can be used to automate communication with the instrument (configuration, data collection, test sequences, etc.). Three types of scripts are supported: SCPI commands, JavaScript (JS) code and MicroPython (EEZ BB3 only) script. The number of scripts is unlimited and can be defined in IEXT or created by the user. A shortcut can be added to the script for easier launch.

In addition to containing complex programming procedures, a JS script can also contain GUI elements for communication with the user (entry forms, info or error messages, etc.).

The screenshot shows the EEZ Studio interface with a JS script editor open. The script content is as follows:

```

1 //Preamble;
2 //<format>, <type>, <points>, <count>, <xincrement>, <xorigin>, <yincrement>, <yorigin>, <reference>
3 //<format>: 0 (BYTE), 1 (WORD) or 2 (ASC).
4 //<type>: 0 (NORMAL), 1 (MAXIMUM) or 2 (RAW).
5 //<points>: an integer between 1 and 128000000.
6 //<count>: the number of points to average sample mode and 1 in other modes.
7 //<xincrement>: the time difference between two neighboring points in the X direction.
8 //<yincrement>: the vertical difference between two neighboring points in the Y direction.
9 //<xorigin>: the start time of the waveform data in the X direction.
10 //<reference>: the reference time of the data point in the X direction.
11 //<yincrement>: the waveform increment in the Y direction.
12 //<offset>: the time offset relative to the "Vertical Reference Position" in the Y direction.
13 //<reference>: the vertical reference position in the Y direction.
14
15 const CHUNK_MAX_POINTS = 1000000;
16 const NUM_CHANNELS = instrument.properties.channels.length;
17
18 connection.acquire();
19
20 var displayedChannels = [];
21
22 for (var iChannel = 1; iChannel <= NUM_CHANNELS; ++iChannel) {
23     var displayed = await connection.query(`CHANnel${iChannel}:DISPlay?`);
24     if (displayed) {
25         displayedChannels.push(iChannel);
26     }
27 }
28
29 if (displayedChannels.length > 0) {
30     connection.command("ACQuire:DEPth auto");
31     connection.command("WAVeform:MODE raw");
32     connection.command("STOP");
33     connection.command("WAVeform:FORMAT byte");
34
35     var samplingRate = await connection.query("ACQuire:SRATE?");
36     var timescale = await connection.query("TIMEbase:SCALE?");
37
38     var chunk_points = Math.floor(CHUNK_MAX_POINTS / displayedChannels.length);
39
40     for (var iDisplayedChannel = 0; iDisplayedChannel < displayedChannels.length; ++iDisplayedChannel) {
41         var iChannel = displayedChannels[iDisplayedChannel];
42
43         connection.command(`WAVEform:SOURCE CHAN${iChannel}`);
44
45         var channelScale = await connection.query(`CHANnel${iChannel}:SCALE?`);
46         var channelOffset = await connection.query(`CHANnel${iChannel}:OFFSet?`);
47
48         var unit = await connection.query(`CHANnel${iChannel}:UNITS?`);
49         var colorInverse = instrument.properties.channels[iChannel - 1].color;
50         var colorInverse = instrument.properties.channels[iChannel - 1].colorInverse;
51         var label = `CHANnel ${iChannel}`;
52
53         var preamble = await connection.query("WAVEform:PREamble");
54         var preambleArray = preamble.split(",");
55
56         var numPoints = parseInt(preambleArray[0]);
57
58         var yinc = parseFloat(preambleArray[1]);
59         var yor = parseFloat(preambleArray[2]);
60         var yref = parseFloat(preambleArray[3]);
61
62         if (label === "CHANnel 1") {
63             ...
64         }
65     }
66 }

```

The interface has several numbered callouts:

- 1: A red circle over the 'SCPI Run' button in the left sidebar.
- 2: A red circle over the 'SCPI Screenshot' button in the left sidebar.
- 3: A red circle over the 'Edit Shortcut' button in the top right.
- 4: A red circle over the 'Run' button in the top right.
- 5: A red circle over the 'Show Terminal' button in the top right.
- 6: A red circle over the 'Search and replace' field in the top right.

Fig. 30: Instrument scripts

#	Option	Description
1	Add script	Creating a new script. It will be necessary to define the name and type: SCPI, JS or MicroPython (EEZ BB3 only).

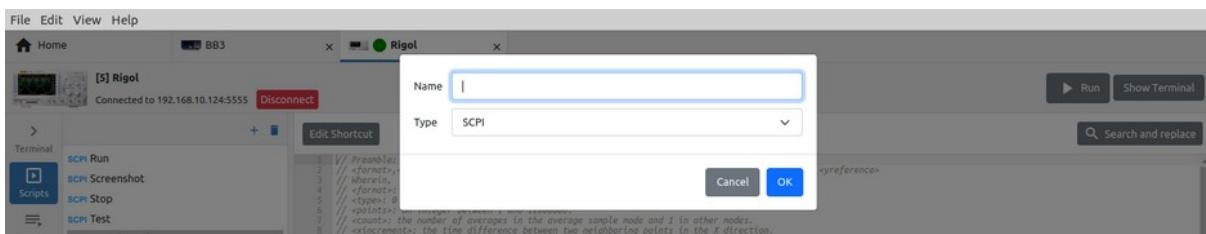

Fig. 31: Adding a new script

The content of the script is entered in the editor (Fig. 32).

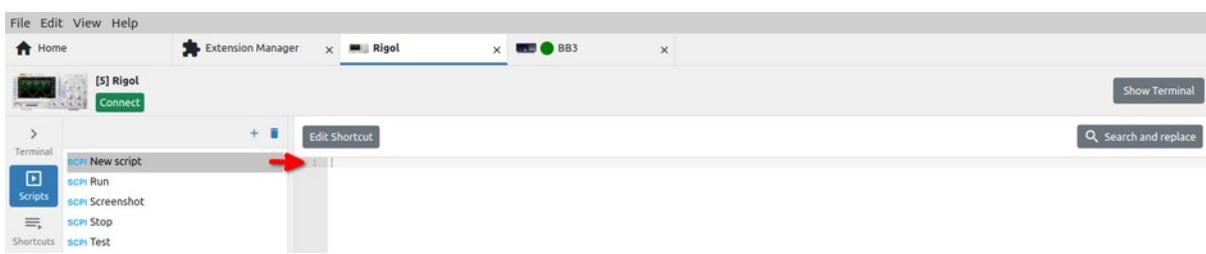

Fig. 32: Script editing

2	Delete script	Deleting the selected script.
3	Edit shortcut	Editing a script shortcut (see Section I2.4.1)
4	Run	Runs the script on the instrument. This option is only displayed if the connection to the instrument is established.
5	Show / Hide terminal	Show / hide Terminal on the right.
6	Search and replace	Script editor function for searching and replacing text in the script. By default, only the search field is displayed. To replace the found text, it will be necessary to click on the "+" sign.

## I2.4.1. Edit script shortcut

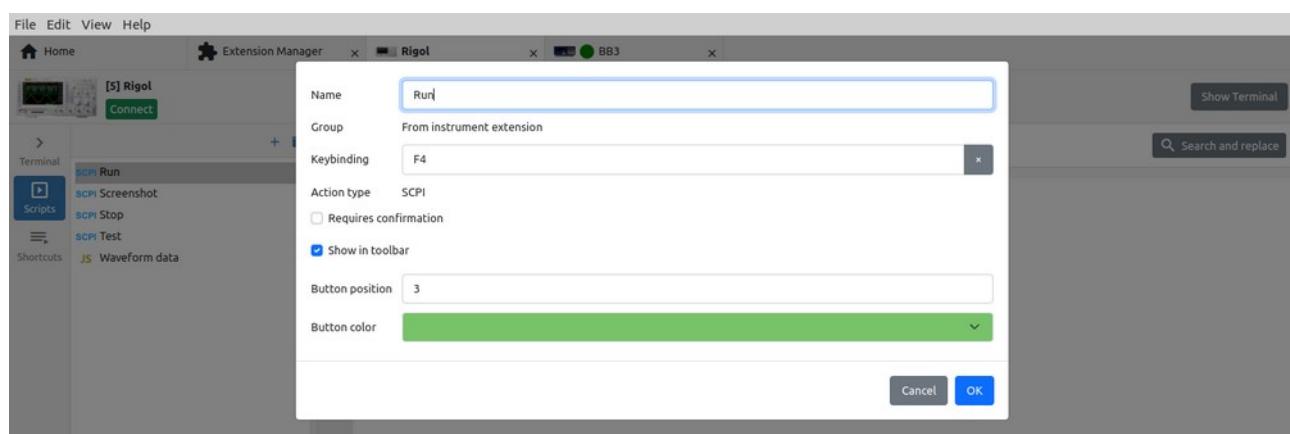

Fig. 33: Script shortcut editing

Option	Description
Name	The name of the script shortcut as it will be displayed in the shortcut bar.
Group	The name of the group to which the shortcut belongs. If the shortcut is defined in IEXT, the label <i>From instrument extension</i> will be displayed.

<i>Keybinding</i>	A key or a combination of several keys (e.g. with SHIFT, ALT, CTRL) that will start the execution of the script.
<i>Action type</i>	Script type: SCPI, JS or MicroPython (EEZ BB3 only).
<i>Requires confirmation</i>	Displays a dialog box to confirm the execution of the script.
<i>Show in Shortcuts bar</i>	Determines whether the shortcut button will be displayed in the <i>Terminal's Shortcuts bar</i> .
<i>Button position</i>	The position of the shortcut button in the <i>Shortcuts bar</i> . When displaying, the shortcut with a lower value will be displayed first. If there are multiple shortcuts with the same value, they will be sorted alphabetically.
<i>Button color</i>	Color coding of shortcut button.

## 12.5. Shortcuts

Shortcuts are used to simplify the execution of scripts and can be defined in IEXT or user defined.

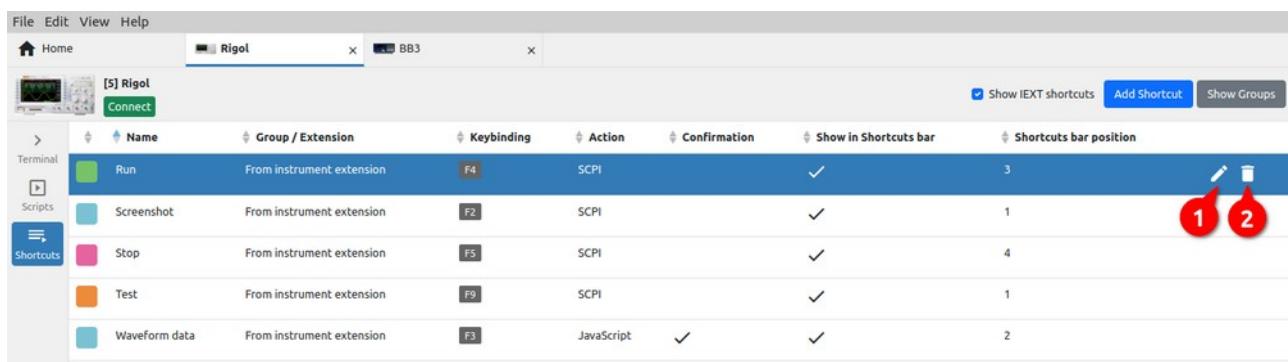

Fig. 34: Instrument shortcuts

#	Option	Description
1	<i>Edit shortcut</i>	Editing the shortcut (see Section 12.4.1)
2	<i>Delete shortcut</i>	Deleting an existing shortcut.
	<i>Show IEXT shortcuts</i>	Filters the display of Shortcuts belonging to the installed Instrument Extension (IEXT).

*Add Shortcut* Adding a new shortcut opens the entry form as shown in Fig. 35.

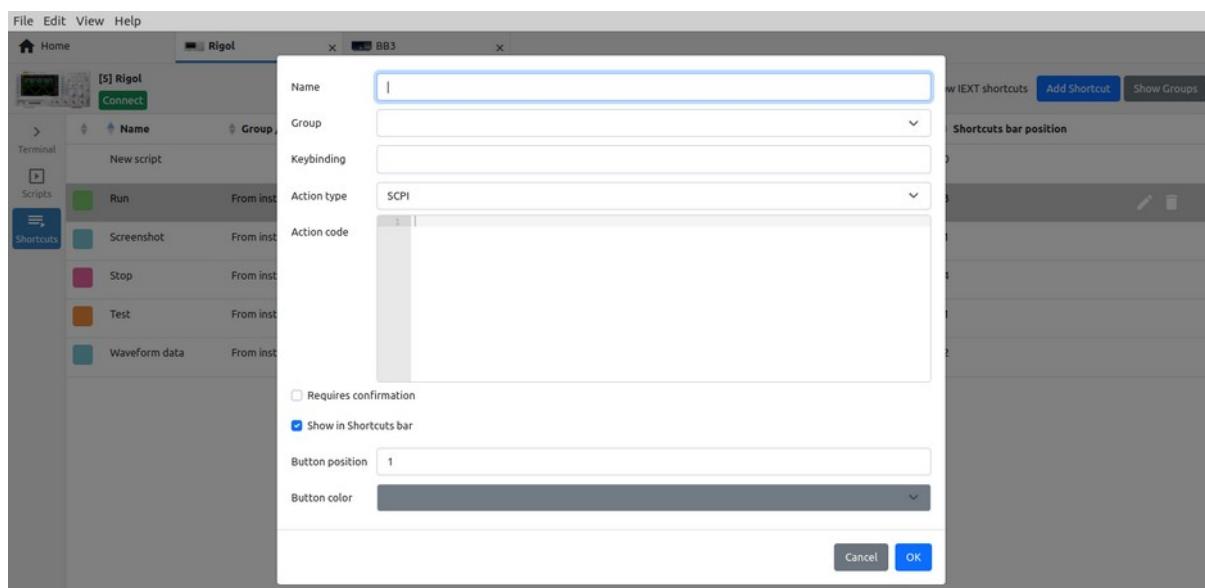

Fig. 35: Add new shortcut

## 12. Instrument activity bar

### Show Groups / Show Shortcuts

Toggle between displaying a list of shortcuts and groups (Fig. 36) of shortcuts.

Fig. 36: Instrument shortcut groups

## 12.6. Lists

Lists are used to program parameters for instruments that support SCPI list commands. Lists for programming value and duration of output voltage and current for EEZ BB3 will be described below.

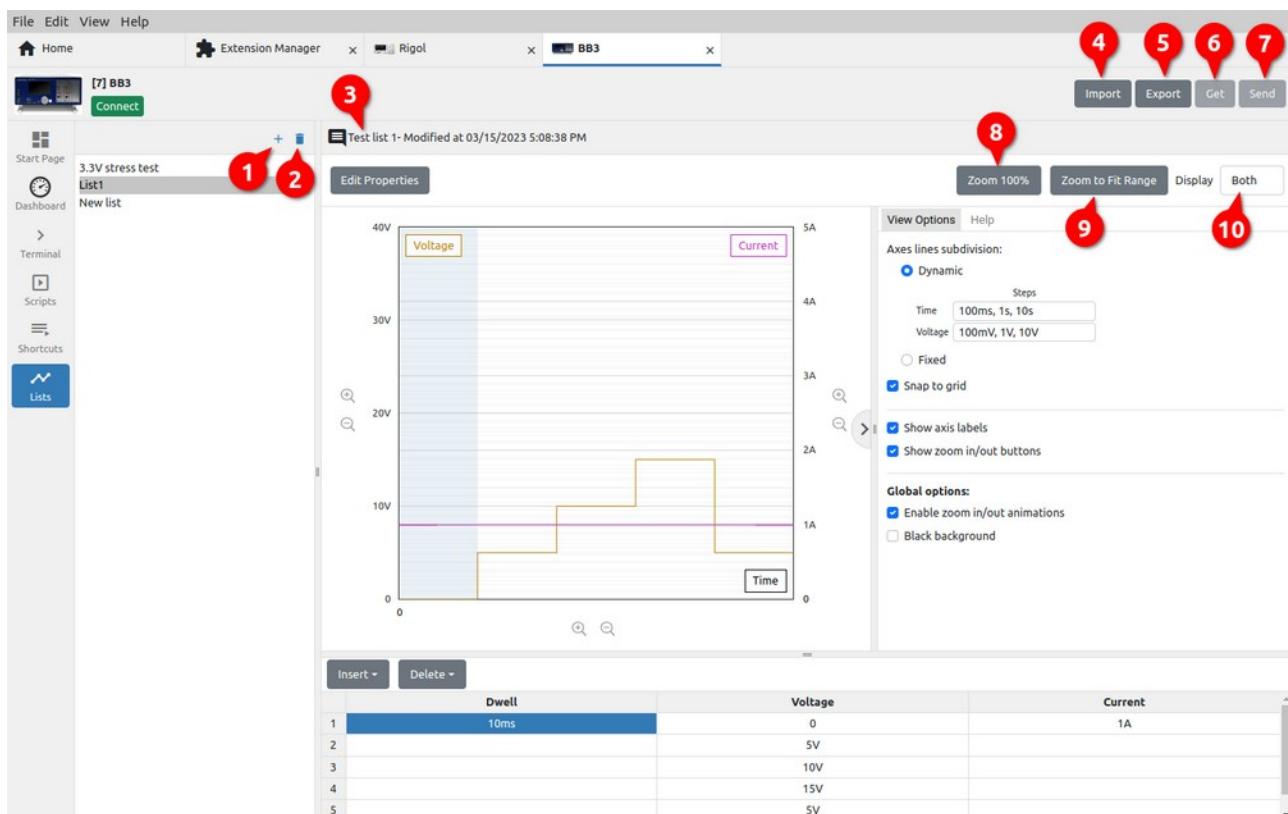

Fig. 37: Instrument programming lists

### # Option

1 *Add list*

### Description

Creating a new list. The parameters of the list can be specified through a table (Fig. 37) or by defining envelope points that show the change of the parameter value over time.

In addition to the list *Type*, it will be necessary to define a *Name* and optionally a *Description*.

2 *Remove list*

Deleting the list (use *Undo* from the *Edit* menu to restore).

3 *List info*

List description and datetime of last changes.

4 *Import*

Import list from local storage. Opens a new dialog box for selecting the folder and name.

5 *Export*

Export list to local storage. Opens a new dialog box in which a list file can be selected.

**6 Get**

Receiving a list from the instrument. The option will be disabled if connection is not established with the instrument.  
Opens a menu (Fig. 38) where you can choose the source (e.g. channel) from which the list will be received. For the imported list, it is necessary to enter the name and description (Fig. 39).

*If the selected source does not have a defined list, an empty list will be imported.*

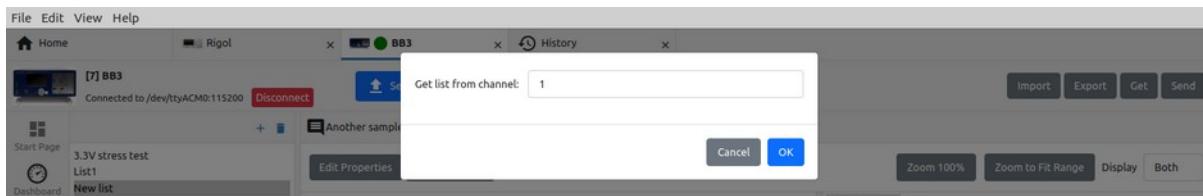

Fig. 38: List source selection

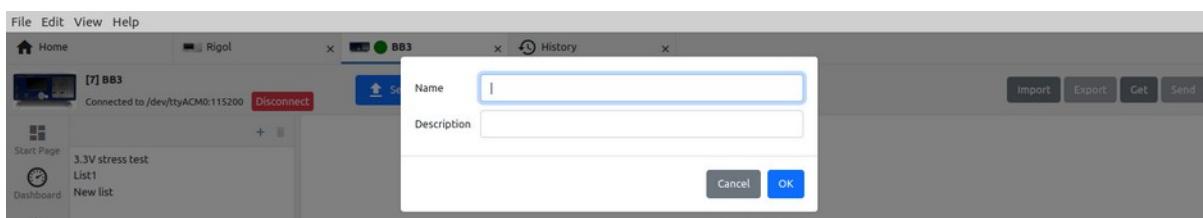

Fig. 39: Imported list parameters

**7 Send**

Sending the list to the instrument. The option will be disabled if connection is not established with the instrument.

**8 Zoom 100%**

Display graph without scaling.

**9 Zoom to Fit Range**

Graph display scaled according to the largest defined value.

**10 Display**

Selection of graphs to be displayed (e.g. voltage only, current only, both).

### 12.6.1. Editing a list using a table

Editing the list via the table is shown in Fig. 37. The program parameters graph is drawn simultaneously with editing the table at the bottom of the graph. In the case shown, the list contains two program parameters: *Voltage* and *Current*, for which values should be entered as well as duration (*Dwell*). To define the value, it is possible to use the units prefix, e.g. ms for dwell, mV for voltage, and mA for current.

In Fig. 40 and Fig. 41 shows all options for inserting new lines and deleting existing ones.

Insert	Delete	Dwell	Voltage	Current
Insert row above		10ms	0	1A
Insert row below			5V	2A
			10V	1A
			15V	1A
			5V	2A

Fig. 40: Table insertion options

Insert	Delete	Voltage	Current
	Delete row	0	1A
	Clear column from cursor down	5V	2A
	Delete all from cursor down	10V	1A
	Delete all	15V	1A
		5V	2A

Fig. 41: Table deletion options

## 12.6.2. Editing a list using an envelope

In contrast to the previously mentioned editing of the list, where it is necessary to define program points through a table, envelope mode allows program points to be defined directly on the curve of the parameter being edited. This can simplify and speed up the whole process.

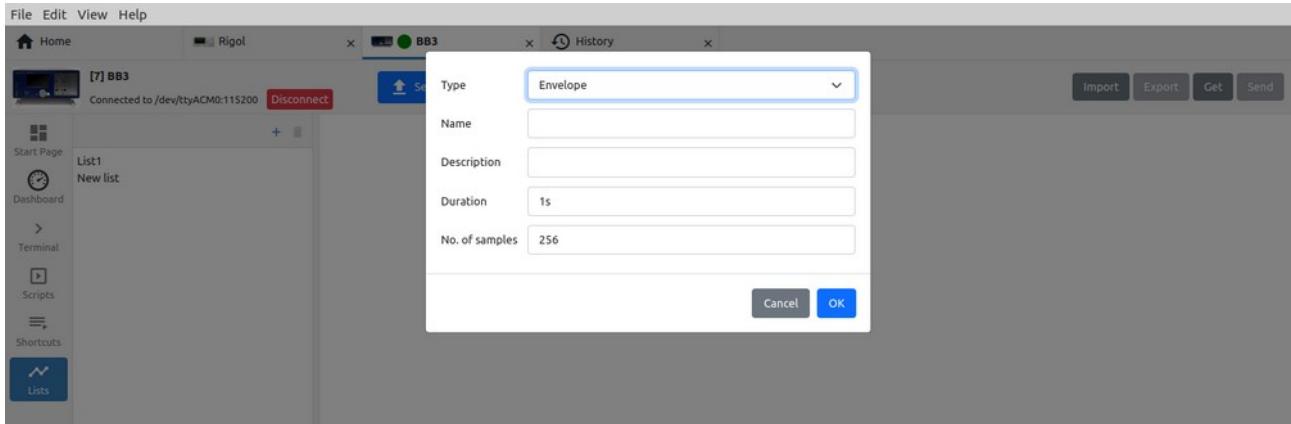

Fig. 42: Adding a new list in envelope mode

When creating a new list in envelope mode, it will be necessary to set two more parameters: the total duration of the program sequence and the number of samples (Fig. 42). The former is needed to be able to display the duration in the graph, and the later is needed to know how many points should be generated in total when sending the list to the instrument.

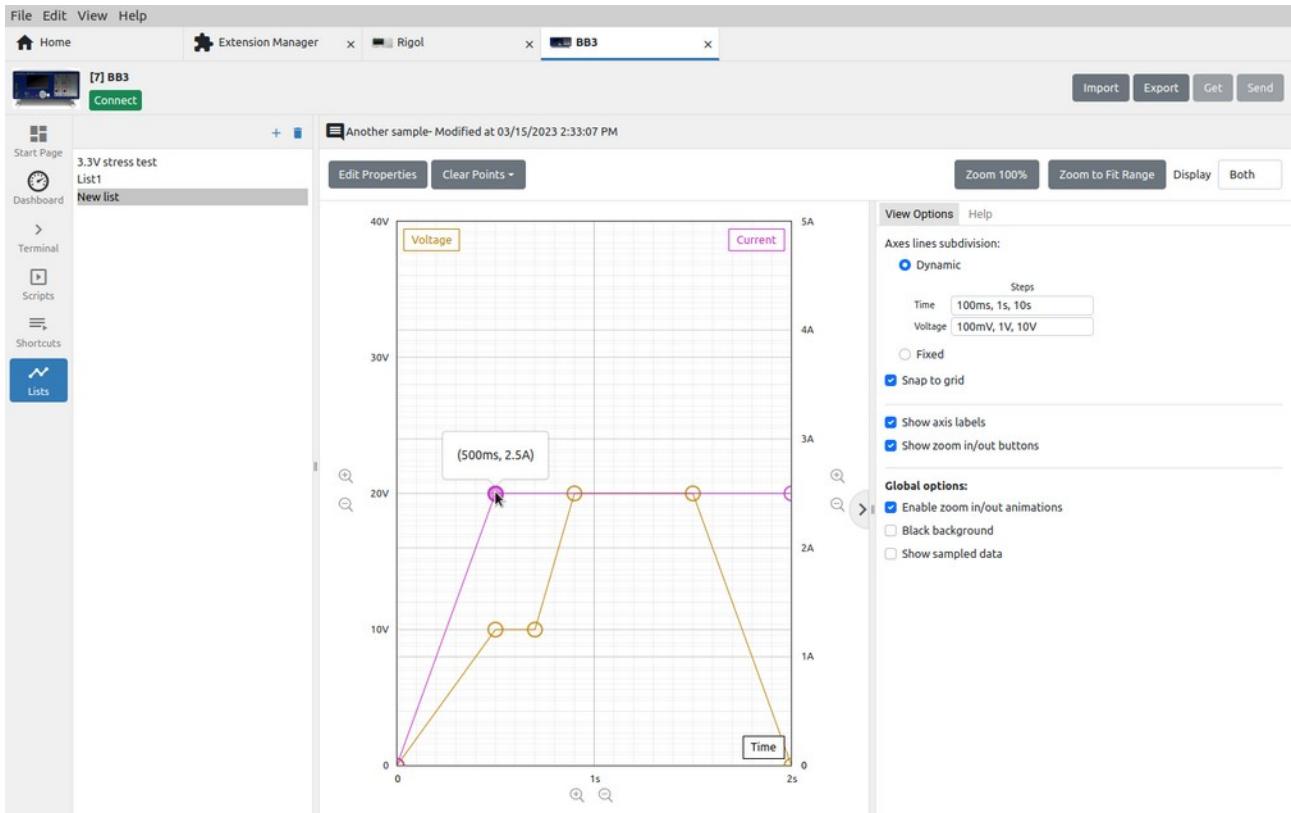

Fig. 43: Graph editing in envelope mode

The example in Fig. 43 contains 6 programming points for setting the voltage (light brown) and 3 for setting the current (magenta).

Adding a new point is simple: you only need to position the cursor somewhere in the graph and click, and a new point will appear, which will be automatically connected to two adjacent ones.

If we want to move the point in any direction, it will be necessary to position the cursor on it again and drag&drop it to a new position somewhere in the graph.

## EEZ Studio Reference Guide

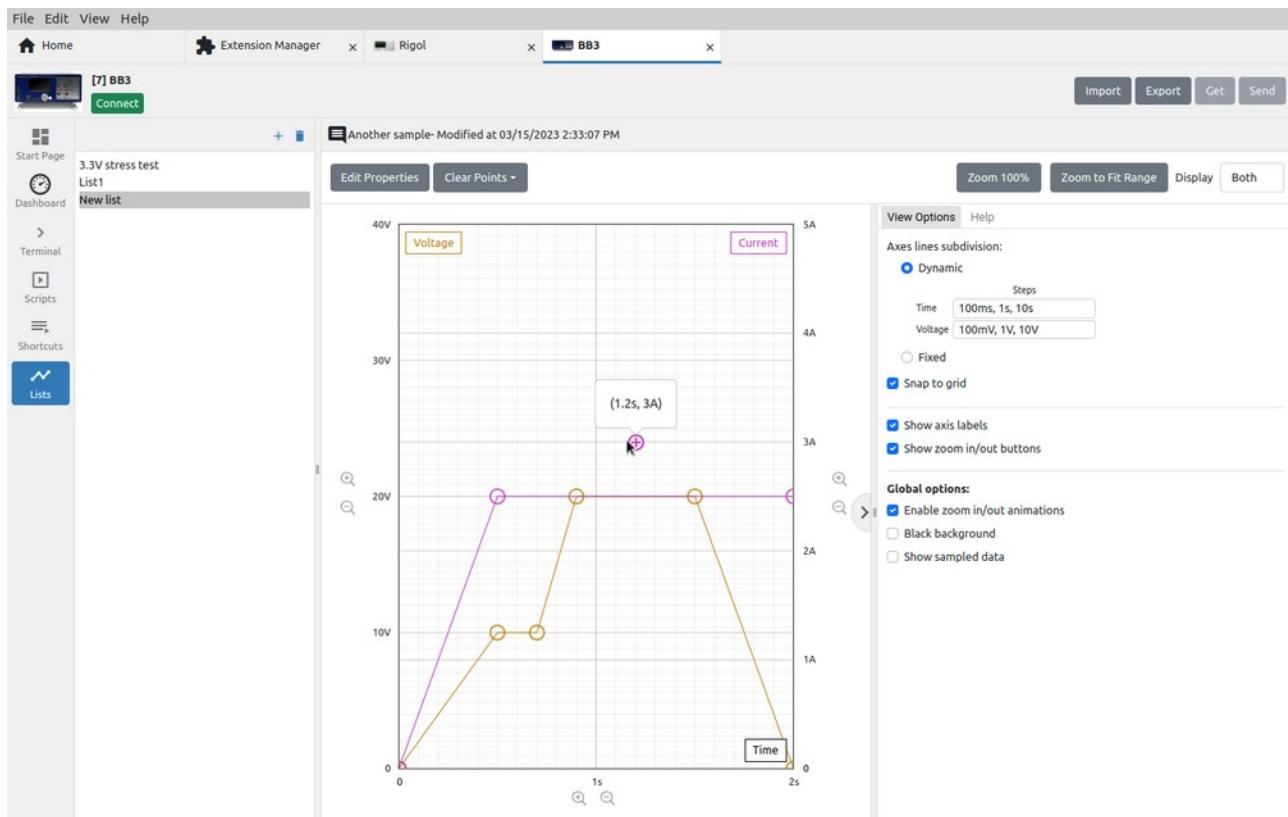

Fig. 44: Adding a new point in envelope mode

If you want to delete an existing point or manually edit its parameters after you have positioned yourself on it, you only need to click once more with the mouse when a dialog box will appear as shown in Fig. 45.

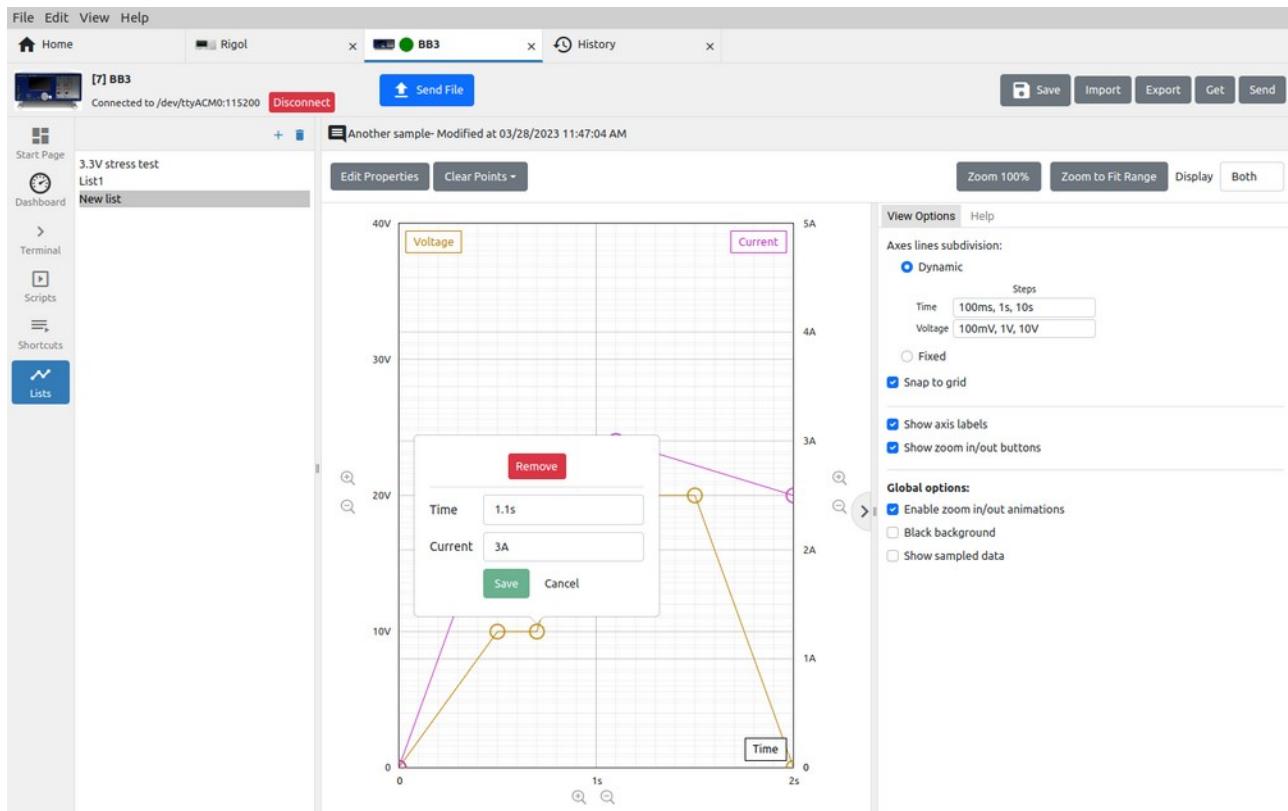

Fig. 45: Program point editing in envelope mode

### I2.6.3. List view options

The display of the graph can be dynamically changed (Fig. 37) depending on the resize of the window or the number of graticules can be fixed (Fig. 46).

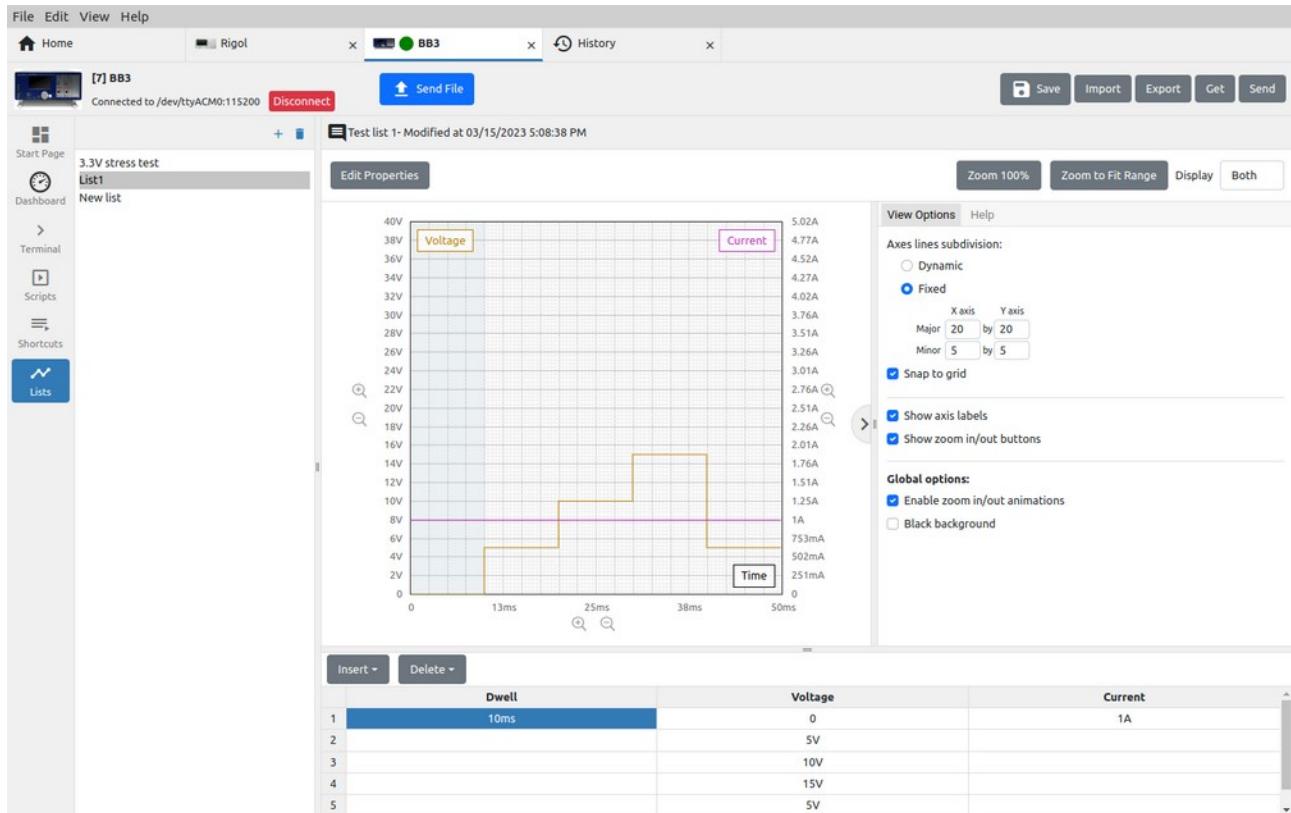

Fig. 46: Fixed graph view

### I2.6.4. List help

For zooming and navigating the graph, in addition to the zoom options located next to the x- and y-axes of the graph ("+" and "-" magnifier signs), a combination of mouse keys and control keys can be used. These additional options are shown in the Help tab as in Fig. 47.

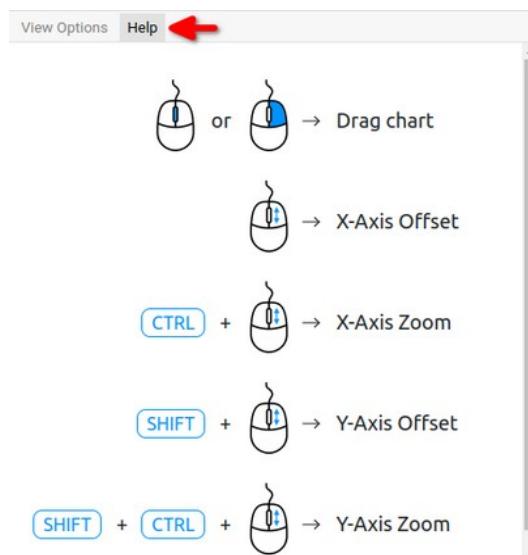

Fig. 47: Graph navigation and zoom help
